The Septazuma M. Co., near Geronimo, is installing a smelter plant; fourteen carloads of machinery arrived, including three 50 H. P. boilers. Col. Brodie intends starting work on the Crown Point mine, near Prescott.

Mohave county Miner: J. McGregor brought a shipment of ore from the Yellow Ned mine, El Dorado canyon, to the Klugman sampling works, last week, which yielded 9 ounces gold and 146 ounces silver per ton. The shaft on the mine is 60 feet deep and shows an ore body 3½ feet wide all the way.

Prescott Courier: Thompson & Rowe had sixteen tons of ore run through the Silver Flake mill at Prescott with satisfactory results. J. Chambers had a lot of ore run through the same mill, giving \$40 a ton gold.

Arizona Bulletin: M. Alexander reports a strike in the Spenzuma mine of a 10-foot ledge. A good stream of water has been encountered in one of the tunnels.

Pick and Drill: The Congress mine has reached a depth of 1700 feet, Crowned King 1000 feet, Planet-Saturn 700 feet, Little Jessie 500 feet, McCake 500 feet, Jersey Lily 450 feet. Every gold mine in Yavapai county, with two exceptions, that is working at a profit has been developed and equipped by the wealth taken from the mine.

Prescott Courier: Near Placeritas the company operating on Millner's property in French gulch has struck copper ore which is 14 feet across, and the erection of a smelter at that point is contemplated. The Monte Cristo mine near Prescott continues to show well. Three feet of ore has been struck in the north drift and 2 feet in the south drift.

Mohave Miner: D. W. Risher has begun operations on the American Flag mine, Walapai mountain.

Globe Belt: G. Bowen is working on the Great Republic group of five copper claims in Pinto district, and the properties are showing well.

Arizonian: At Dos Cabezas the Philadelphia mill is being reconstructed. The hoisting works of the Philadelphia and First Chance are being overhauled with a view of starting development. At Silver Bell, Pima county, the new furnace was blown in last week and is using forty tons of ore daily.

The Holland mine is shipping high-grade ore from the Harshaw district. Assays show 2000 ounces in silver per ton. The Crowned King mine, Yavapai county, is known only as a gold mine, but its ore produces about twelve ounces silver per ton. The Congress ore carries a good deal of silver. Ore from the McCabe mine carries six ounces gold to twenty ounces silver per ton. Ore from the Monte Cristo carries one hundred and fifty ounces silver to four ounces gold per ton.

Phoenix Republican: An experimental run of the steam shovel is going on in Walnut Grove on the placer banks. The old Crook mine in Yavapai county is to have a stamp

mill. The property is said to be looking well. Lyons' new quartz mill on the Hassayampa is completed. Supt. Clark of the Fools Gulch mine has twenty-five men at work. He has reached a depth of nearly 800 feet and will continue until 2000 feet is reached, when the mill will be started. A vein of ore 3 feet wide, running \$30 per ton, is said to have been recently struck. The Storm Cloud mine near Prescott is proving a good property.

CALIFORNIA.

Amador.

Jackson Ledger: On the new shaft for the Kennedy at Jackson, V. S. Garbarini has a force at work excavating for foundations and preparing to erect buildings to contain the new machinery, which is to be the best on the mother lode. The plant will at first be operated by steam, but is to be constructed to be operated by water or electricity. A ledge has been encountered in the Balliol shaft about 20 feet thick. The owners of the property intend opening the property for milling.

At the Jackson Exploration and D. Co.'s property the past week Gen. Mgr. Dye had his force cleaning and repairing the reservoir, and its capacity has been doubled. In Pine Grove district the Douglas mine has been operated by J. Ross, Jr., of Sutter Creek, for the past year. The development work has progressed to such a point that a mill is to be erected on the property forthwith.

Jackson Republican: At the Spagnoli mine work continues with encouraging results. The sinking will continue at the Zeila mine six weeks longer. At present fifteen of the forty stamps are in use.

Butte.

Oroville Register: M. Scowden bought a quartz mine near Enterprise and has put fifteen men at work.

Oroville Mercury: Clark Bros., who have been mining an old river channel at Big Bend, recently closed down for lack of water, have resumed operations, the late showers having raised the water. They will push work during the winter. The Russel, Wing & Malone Co. will also begin operations at once at their mine. They are said to have good gravel, and anticipate a profitable run.

Calaveras.

(Special Correspondence).—As soon as the rains set in work will be commenced on several claims near here. Hurd & Bunney, who have a lease on the Red Gold mine, have finished a mill run of seventy-five tons and the results were very satisfactory. Peyton & O'Connell have ten men working in their mine known as the Blood property. They have about 150 tons of ore on the dump of good grade. About Dec. 1st they will start their new 2-stamp mill. At the old Sheep Ranch mine they have nearly finished putting in electric power to run the mill. The hoist will be run by steam, and for the first time in four and one-half years this old producer will shortly be in operation. The Utica M. Co. of Angels were compelled to shut down their hoists and compressors last week after a three weeks' run since finishing the repairs to the ditch and flume, owing to the lack of water.

Murphy's, Nov. 28th, '98.

A strike is reported from the Thorn mine, near San Andreas, of a 15-foot ledge. At the Thorpe mine a gallow's-frame, over 100 feet high, is being built. The 30-stamp mill will be running in a few weeks. The old shaft is being timbered and enlarged.

San Andreas Prospect: Work has resumed in the Lamphear mine near Mokelumne Hill, and taking out ore has begun. W. T. Harris has a contract with the company owning the property to get out 7000 tons of rock. It is locally reported that the Eclipse gravel mine on Tunnel Ridge, which has lain idle for seven months, will resume work. The mill on the mine at Collierville was put in operation last week. In the mine there is a ledge from 2 to 6 feet in width which will yield on an average of \$42 to the ton.

San Andreas Citizen: At Murphy's, Schwoerer Bros. are taking out a milling from the old Centennial mine. Heinsdorf & Schwoerer are refitting their 5-stamp mill to run several hundred tons of ore from their mines. Heard & Brunner crushed fifty tons from the Red Gold mine, which proved profitable. L. Hansell has begun operations on the Summit Blue mine. A 2-stamp mill has been built on the Blood mine at Collierville. The Hausell gravel mine is in good shape to be worked awaiting rain. A water wheel, pump and derrick have been built to work the bottom of the channel.

El Dorado.

Georgetown Gazette: The Horseshoe Bar mine at Josephine is being worked with a full crew. J. Shultz continues work on his quartz mine. At Pilot Hill D. Wilkinson has a force at work on the Hidden Treasure mine. Cramer & Bars are doing extensive work on their mine. They have a tunnel in 500 feet. B. M. Berry has resumed work on his mine at Michigan Flat. F. C. Leavitt sold the American River gravel mine near Placerville to C. Noneman for \$1200. E. Holmes sold to W. S. Hickman the Sailor Slide mine near Georgetown.

Placerville Republican: M. E. Ames sold the Green Mountain Tunnel mine near Placerville to G. W. Kimble who has begun work on the property. As soon as the gravel is prospected to justify it a 10-stamp mill will be put up.

Inyo.

Independence Independent: The Reward mine has been closed down. Supt. Hoskins has gone to St. Louis to make arrangements to resume work. At Ballarat Supt. Harrison expects to resume operations on the Cleveland mine soon. Mine owners in South Park district are meeting with encouragement at their work progresses. At Mineral Hill

R. Day, superintendent of a group lately bought, is meeting with success in development work.

Kern.

Near Tehachapi, A. Winters sold four claims of antimony mines to F. De Frietas, agent of the Rapid Transit R. E. Co. of New York, for \$20,000. A shaft has been sunk 60 feet, and antimony 90 per cent pure taken out.

Randsburg Miner: A strike of good ore is reported on the Black Hawk mine near Randsburg. The cost of the new 30-stamp mill for the Yellow Aster M. Co. is said to be \$41,500. The Red Dog mill people have given up their bond on the G. B. mine. Ten tons of ore milled from the Merced mine yielded \$1450 in bullion. The Eureka mill has been running on small lots of ore, but in nearly all cases of good quality. They are now at work on Wedge ore. On the Standard good ore was found last week. A new strike is reported in the Triby mine, of the Yellow Aster group. The body of ore is said to be large and what has been milled averages \$30 per ton.

Randsburg Miner: Edmonds & Stassforth had three tons of ore milled at the Eureka mill, Randsburg, which plated \$25 a ton. Ten tons from the Merced yielded \$1440. This is the second cleanup in three months, the result of three men's work, the first going \$1600. After paying a royalty of 25 per cent and expenses they have left \$2000. Twelve tons of Wedge ore yielded \$1200. This came from the 350-foot level. The Eureka mill cyanide plant made a cleanup last week of \$900. This is the third in three months, the first being \$1200 and the second \$1100. Fifteen tons of ore from the Buckboard mine netted \$50 per ton. This is the richest part of the mine; they have in some parts of it a ledge 25 feet thick, which will mill from \$5 to \$8 a ton. The Red Dog mill at Johannesburg is running on Butte ore. They cleaned up \$5000 from ninety tons. Willard & Harrison are moving their mill at Cuddeback lake to the Blackhawk mine near Randsburg, where there is a large body of ore that will run from \$5 to \$40 a ton. They will get water from the Squaw Springs system and connect with a pipe line.

Lassen.

Work on the Hayden Hill mine has been suspended for the winter.

Los Angeles.

Work on the Red Rover mine, near Acton, has resumed and a new reservoir has been built.

The Puritan mill at Acton will be shipped to the mine of E. D. Cot in Kern county.

Mariposa.

Mariposa Gazette: The Big Betsy mine at Coulterville is working twenty men. They have finished a new hoist. A. T. McKenzie is Supt. The Columbus M. Co. has been organized in Coulterville and has bought the Lafayette, Eureka, Black Horse, Alba, White Ball and Eureka No. 2 mines and will begin work on them without delay.

Sonora Banner: On the east belt, near the Tuolumne county line, the Big Betsy mine, owned by the Golden Crown Co. of San Jose, has been under development for a year. The shaft from the 350 level has been retimbered to the surface. The new hoisting works are completed and a 10-stamp mill will be built. Sinking continues and twenty-five men are employed.

Nevada.

The main tunnel of the Columbus drift mine near Nevada City is in 1800 feet. They expect to reach the channel in 200 feet.

Work has been suspended on the Columbus mine, near Nevada City, on account of the death of its owner, C. Waterhouse.

The sheriff last week sold sixteen and three-quarters acres of land belonging to the Gold Hill M. Co. to W. H. Martin for \$500, to satisfy a judgment for \$870.11 and costs. The company are the owners of the Nevada City mine. Mainhart & Co. have closed down their mine near Emigrant Gap for the winter.

The machinery at the Empire mine at Grass Valley is being run by electricity.

Grass Valley Telegraph: A strike has been made in the 700-foot level of the Merrifield mine at Nevada City, owned by the Champion Co. The ledge is large and of good grade.

Nevada City Herald: When water for mining can be had a monitor will be in operation on the Gravel Hill claim near Nevada City. A restraining dam is being built, permission having been granted for same, and 2000 feet of pipe line is being laid to the South Yuba ditch. About 1000 feet of sluices will be built. Twenty men are employed. The Gravel Hill is owned by A. M. Gray of San Jose and S. L. Bullard of Los Gatos.

Grass Valley Union: A crushing of ore was recently made from the Gladstone & Bismark mine, near Nevada City, which yielded \$10 per ton, exclusive of the sulphurets, which are high grade. The mine is controlled by S. Smith.

Grass Valley Miner: The Eagle Bird mine at Maybert, which was closed down all summer for lack of water, has started again. Men work on the day shift and the mill is kept running at night. As soon as there is water enough, both shifts will be put on again and the mill will run night and day.

Grass Valley Tidings: San Francisco and Sacramento capitalists will operate the Junction mine, near North San Juan. They propose to put up a mill right away. E. Donald of Sacramento will superintend the work.

Placer.

The recent rains have enabled the Gold Blossom and Three Star mines near Auburn to start their mills and resume work in the mines.

Plumas.

Quincy Independent: The Butterfield M. Co. is doing well on Squirrel creek, near Quincy. Over \$200 were taken out in one day last week. Last week J. S. Webber, P.

Kinney and T. Keams of Utah were examining the Pliocene gravel mine near Quincy.

Quincy Bulletin: The Bullion mine in Mohawk has six men developing the property. The ledge is reported 8 feet wide. Last week were started five stamps on the Bushman quartz mine near Quincy. The mill has ten stamps, all of which will be running when the water supply increases. It is reported that the Scott mine near Quincy is again in gravel and taking out \$20 a day to the pick.

Riverside.

A new vein of ore has been opened in the Gavilan mine, near Perris, at a depth of 400 feet. The men working on contracts in the Good Hope mine are reported doing well. Hook Bros. made a shipment of \$500 last week from the Santa Rosa cyanide plant, near Perris.

W. Vercoe of Riverside, Supt. of Gavilan gold mines, has returned from England. It is locally reported that he effected the sale of the Santa Rosa mine to an English corporation. W. A. Doran, Pres. Gold Canyon G. M. Co., whose properties are situated near Salton, is preparing to build a 6-stamp mill. There are several hundred tons of ore on the dump ready to be crushed. Burke & Townsley, in the Chuckawalla mining camp, near Salton, have four men at work and fifty tons of ore on the dump.

San Bernardino.

At the Rose mine, near Victor, the new shaft is down 250 feet. It is believed necessary to go 150 feet more to get into the pay ore. They are working three shifts; erecting the new cyanide machinery will soon begin. Machinery and supplies continue to go to the Dale mining district.

San Diego.

Yuma Sun: The mines at Venus Camp, Picoacho district, owned and operated by H. W. Blaisdell, have a fifty-ton cyanide plant in operation. The second monthly cleanup was made recently and the value of the bullion brought down was said to be \$35,000, while the expenses were about \$12,000. The previous month's run was \$29,000.

Shasta.

J. F. Flannery has sold to the Iron Mountain Investment Co. the Crown Point, Ophir, Young America and Big Emma mining claims in Flat Creek mining district. Among the improvements by the Mountain Copper Co., the latest is a steam shovel to load the calcined ore into cars for the smelter. The work formerly required ten men fifteen minutes to load a car, while the steam shovel does the work in less than two minutes.

Bigrave & Collins are taking out good ore from their lease on the Washington mine at French Gulch. Van Matre & Fox are taking out good quartz in the same neighborhood.

Shasta Courier: H. Paige has leased the Pugh & Malcom placer claim on Clear creek, near Shasta, and will work the property when the rains begin.

Redding Searchlight: French Gulch mines last week shipped 154 sacks of ore to the Selby smelters. A shaft is being sunk on the White Oak mine in the Harrison Gulch district, by Capt. Roberts and his company.

Sierra.

(Special Correspondence).—The Alta mine near Alleghany, a property that had been abandoned for years and upon which work was resumed a few months ago, has found a streak of good ore. T. J. Parsons of San Francisco is interested in the enterprise.

At the Oriental mine Mgr. Hill has accomplished much work during the few months since he began rehabilitating the old property. The mine is being unwatered at the rate of 500 gallons a minute.

At the Plumbago work continues on the power and air transmission plant. Of the 6600 feet of flume 4600 are completed. The mine is producing its usual quota of ore.

The resumption of work on properties abandoned years ago at shallow depth is gradually increasing in this district.

Alleghany, Nov. 25th, '98.

At Boston Flat the Steamboat Tunnel, being run by Langman and five other miners from Grass Valley, is in 1200 feet and the ground is good.

Downieville Messenger: After another short run Buckingham and Bothwell made a satisfactory cleanup at their quartz mine near Downieville. Last summer a mill was erected at the mine, but it has not worked satisfactorily, and the owners contemplate improvements early next season.

Slaskiyon.

The Cherry Creek M. Co., near Yreka, is putting up a 10 stamp mill. They have 500 tons of ore on the dump.

Yreka News: A company, represented by M. Thornton, has bought the old Allen property in Quartz valley and will immediately employ a large force. T. E. Williams has taken a contract to extend the lower tunnel in the Mountain Belle mine in Hamburg district. This is the property formerly known as the Cartwright & Phillips mine. It was purchased not long ago by a Cincinnati company, represented by R. M. Shearer, the present Supt. The Antelope mine, formerly known as the old Drummer Boy, has been bought by Hunter & Mahler, who have partially cleaned out the tunnel and drift and uncovered a 4-foot ledge that will mill \$20 per ton. This property was worked in the early days by a horse arrastra. There are over \$4000 on the waste dump that can be saved by modern methods.

Yreka Journal: A Chinese company, having leased the Pacific mine, in Klamath river, will continue operations day and night, until high water drives them out. The Chinese working the McConnell & Quinne mine, Klamath river, have been troubled by the breaking of old drifts in sinking to bedrock.

They have been successful in their cleanups. —The Gold Run and Know Nothing Creek mines, in the Salmon river country, are running with a full force and are said to be paying well. —The Lang & Bratt quartz ledge at Horse Creek, Klamath river, is turning out well. The ledge is 6 feet wide. —Jillson & Co. are taking out good quartz at Cottonwood. —The Spangler Bros., at mouth of Humburg creek, are prepared to carry on extensive operations as soon as water is obtained.

Trinity.

Seventeen tons of pipe for the J. P. Wood hydraulic mine at Junction City are en route from Redding.

At Bragdon river mining is followed with success and the quartz mine of Rogers & Thresher is proving a good property. —Near Trinity Center Perry Bros. & Co. have leased the Robinson mining property and are working the ore by the cyanide process. —Strode Bros. have closed their mine near Carrville for the season.

The Chamberlain claim near Lewiston, worked with one giant and water supply for eight hours daily, has put in new boxes and will run all winter. —The La Grange mine near Weaverville has cleaned out its ditches and is making five hours' run daily. They will run three eight-hour shifts when water supply permits.

The Mountain Boomer mine, in the New River district, is being extensively worked by San Francisco capitalists, together with J. W. Frank of Red Bluff. The mine is an old property, worked years ago, and was given up as being worked out. The old works have been reopened at a depth of 240 feet and an upraise made in which a 30-inch ledge has been uncovered which is said to run \$40 a ton. A new tunnel is being run which will be 650 feet below the old one.

Tuolumne.

Jamestown Nugget: The Mexican M. Co. has placed on the group of mines recently bought from Urquart Bros. machinery to thoroughly develop the property. —The Mt. Jefferson at Big Oak Flat is opening up new ground and has good milling ore ready for stopping. —The Big Oak Flat Nos. 1 and 2, owned by the T. M. L. M. & D. Co. of Fresno, are running day and night. They have five stamps going at present and are preparing to add ten more. —The Mack mine, idle for many years, is being reopened by Oakland people. They are working three shifts of men and have sunk 50 feet in the past three weeks, finding good ore. This makes the shaft 200 feet deep. Drifting has begun. The same people have a bond on the Woodin mine and will start work on it soon. —The Accident mine, owned by James Bros., has been bonded to M. Doan of Boston. —The Whisky Gulch mine, bonded to J. L. Roberts, gave an average mill test from the new shaft of \$38.52 per ton. —The Longfellow mine has a new hoist plant and patent dump skip and will sink 500 feet. —The San Juan mine, owned by M. Fisher and others of San Francisco, is preparing to get new machinery and being developed. —At the Ophir mine M. King took out over \$800 last week. —M. Gillespie of Oakland has bonded a mine from J. Baitano and begun work. —On the Slap Jack mine a body of milling ore was discovered. —Argle & Paw in the Dewey mine have found a 3-foot vein of \$18 ore. —The Big Betsy mine has uncovered a body of high-grade ore. It is said that a stamp mill will soon be erected. M. Hillish of San Jose is the owner. —Shafer & Co. found a 3-foot ledge that mills \$7.50 a ton.

Sonora Democrat: Progress is being made in development on the Excelsior mine near Sonora. —The Shawmut-Eagle mine near Jacksonville has been running full capacity the entire dry season. —More good rock was taken from the chute of the Hope mine near Sonora last week. —Indians are reported to have discovered good gravel diggings on the Tuolumne and men and squaws are making satisfactory cleanups. —Some placer miners continue to make small wages in Woods creek at Brown's Flat, notwithstanding the bed of the stream has been gone over for fifty years. —On the Booker ranch R. Stevenson has a force driving a shaft on an extension of the Scrub Oak. —The Bonanza mine has closed down and the workings allowed to fill with water. The mill is also hung up. Work will be resumed when water can be secured for power. The mine is equipped with a steam plant, but the difference between \$3 and \$15 per H. P. caused the cessation of work. The mine can be unwatered in ten days.

Yuba.

At the Pennsylvania mine, Brown's Valley, a 300 H. P. electric motor is being placed and a cable road built from the shaft to the mill. A station is being cut at the 600 level, where an electric pumping plant will be located.

COLORADO.

The Denver mint receipts for November show a total of \$1,923,718, as against \$1,237,199 for the same month of 1897. The receipts for the first ten months of 1898 were \$18,269,271, as against \$10,920,844 for the same period in 1897, a gain of \$7,348,427. The gold output of the Cripple Creek district during November is estimated at \$1,447,500.

BOULDER COUNTY.

Boulder News: The Virginia mine at Eldora shipped a trial carload, the best of which run \$1200 to the ton and the screenings \$230. —In the Mogul tunnel, at 775 feet, another vein—the twenty-fourth—fifteen inches wide and two ounces in value has been cut.

Ward Gazette: The Adit mine put on a force last week. The tunnel has been enlarged. Pushing the Nivot branch of the tunnel and getting out ore will be done with speed. —In the Allen a cross lead was encountered which measured 2 feet across, carrying considerable iron.

CLARK COUNTY.

At Silver Plume, Kerns & Wilson, leasers

on the Bismarck, recently shipped nine tons of ore that milled 20 ounces silver per ton. —J. B. O'Connell made a shipment of eight tons from the same mine that returned 208 ounces. —An 18-inch vein of ore running 150 ounces silver per ton has been opened up in the White mine. —The Johnson in Argentine district is turning out ore that mills from 200 to 300 ounces silver per ton and a small percentage of gold.

CLUSTER COUNTY.

At Silver Cliff the Jay Gould has struck good ore with the diamond drill and will start a shaft. —The Troy has been leased by a Cripple Creek company.

EAGLE COUNTY.

Near Red Cliff the Black Iron mine is outputting from 50 to 80 tons of ore per day.

EL PASO COUNTY.

At Victor, Beckman & Co., leasing on the eleventh level of the Orpha May, received returns from a 10-ton shipment last week averaging \$72 a ton. —Three electric hoists were installed by the Colorado Electric Power Co., one on the Deadwood, the Findley, and the Jack Pot. —The Granite mine near Victor is producing thirty tons a day, but most of the rock is low grade. —The Legal Tender of the Golden Cycle Co., near Altman, last month output about 2700 tons.

The production of the Victor mine at Victor has been curtailed to eighty tons daily, of which about one-fourth is sorted into first and second smelting grades, while the remainder goes to the cyanide mill.

At Victor the production of the Gold Coin the past week was 100 tons a day. —The lessees on the Porcupine last week marketed forty tons of ore of high grade. —The Ajax Co. is erecting a plant of machinery on the Ajax on Battle Mountain and making preparations for deep mining. A 125-H. P. boiler, 100-H. P. engine with compressor and pumps are in place. —Three carloads of ore, one of high grade, and the remainder two-ounce ore, were shipped this week from the Trail, controlled by the Battle Mountain Co.

Victor Record: The Fluorine mine, near Victor, is to be operated by its owners, the Montreal G. M. & M. Co., instead of the lessees. The mine in eleven months has produced in the neighborhood of \$175,000. Every ton of ore marketed has been mined from no greater depth than 42 feet. —At the Modoc ten to twenty tons daily is the regular production. —The Moon-Anchor produced 200 tons of ore last week, of which about 135 tons was of smelting grade and the balance milling grade. —On the Half-Moon the Johnson lease produced thirty tons a day last week. —A carload of ore recently shipped from the Orpha May yielded \$340 a ton. —Two narrow-gauge cars is the daily output from the Van Amburg & Edwards lease, one of the Raven Co.'s properties. The ore averages \$50 a ton. —The Baltimore Leasing Co., on No. 6 shaft of the Victor, are mining a carload of ore daily, averaging \$28 to the ton. The ore body in the stope from the 160-foot level has widened to 14 feet.

GILPIN COUNTY.

Central City Call: The Piece mine at Central City is making daily shipments of from thirty to forty tons. The mill ore treated at the Hidden Treasure mill runs from three to four ounces gold per cord, and the lessees are doing well. The smelting ore has been averaging \$75 per ton. —At the New Foundland mine ore is hoisted from the 700 level. The last lot of smelting ore gave returns of \$332 a ton for first class, while the screenings went \$179 per ton.

LAKE COUNTY.

At Leadville, the Ibeix mines keep the shipments of gold-copper ore above 8000 tons per month, notwithstanding the new work under way at the six shafts. A place which had been abandoned some time ago as worthless, was opened up again by one of the foremen who thought he could find pay ore, and is shipping fifteen tons per day. —The Resurrection G. M. Co. employs 150 men and ships 200 tons daily. —The Penn mines ship 100 tons daily of gold quartz.

Leadville Miner: The cage in the 1000-foot shaft of the Mab mines is running twenty-four hours every day. Over 200 tons of ore are hoisted and shipped daily from this property, besides handling the waste from the development work under way. This mine is comparatively a dry one, the workings only making 100 gallons of water per minute. The principal owners are local men. —Shipments from the new ore bodies being worked from the interior shaft of the Mahala have averaged 150 tons per day. The grade of this ore averages better than the cores from the diamond drill indicated. The hoisting and pumping from the underground shaft is done with compressed air.

Leadville Reporter: About Jan. 1, the Mahala Co. expects to handle 150 tons of ore a day. They are now shipping about seventy tons a day, and are pushing development work. Their diamond drill explorations show ore bodies of richness and large area.

Leadville Miner: The Ballard mines at Leadville are shipping fifteen tons per day of gold quartz which averages about \$30 per ton. The discovery of pay ore in this mine was made at a cost of \$10,000. The Denver and Rio Grande railroad sent out 750 tons of ore in one day last week. Two local smelters handle ore to their full capacity and three railroads haul the surplus to outside smelters. —The Ardell Mining and Concentrating Co., operating dumps with the Sherwood process, have demonstrated the success of the new undertaking. The material from the Shields and Venture dumps showed values of \$5 per ton, while the concentrates average 72 ounces silver and three-tenths ounce gold. —McDonald & Thompson have started iron shipments at the rate of twenty tons per day. —The Big Four M. Co. and the Fanny Rawlings lease have 130 men on the payroll. The Big Four is shipping fifteen tons daily of gold-copper ore. The Fanny Rawlings is shipping fifty tons of

carbonate and sulphide-copper ores, carrying gold. The ore is 40 feet wide and some of the stopes are 50 feet high. The oxidized ore nets \$45 per ton and the sulphides \$35 to \$40.

MINERAL COUNTY.

The Occidental mine, near Creede, is 130 feet deep and in the last 35 feet has ore of good value; they will soon begin shipping.

PARK COUNTY.

Fairplay Flume: A good strike was made at Puma last week by Gillman Bros. on the Boomer lode at 500 feet depth of a body of ore which ran 60 per cent lead with some silver and gold.

PITKIN COUNTY.

The recent strike on the Argentum-Juniata at Aspen is reported to be 12 feet wide and will average between 300 and 400 ounces in silver.

The recent discovery in the A. J. mine of Aspen was the result of accident. An old stope showed indications of caving, and a few shots were put in to hasten it. This exposed a face of 400-ounce silver ore, which has opened into a well-defined ore body.

SAN JUAN COUNTY.

The output from the Tiger mine at Silverton is twenty tons daily. The force is forty men, and it will not be cut down for the winter.

IDAHO.

At Wardner the Bunker Hill and Sullivan's Kellogg tunnel is in over a mile and is adding 12 feet a day. No very hard rock has been found nor has there been any sign of mineral. It was commonly expected that blind leads carrying ore would be cut before going as far as they go.

At Burke the Hummingbird tunnel made by hand work 96 feet last month.

Near Pierce the American Placer Co. is putting in a hydraulic elevator and will soon be ready for operation. —The Oro Fino Placer Co. is ready for operation as soon as the water supply will justify starting. —The Eureka Con. Placer Co., is operating on Reed's creek, with enough gravel to last twenty years. These are all new companies.

At Warren, in the Good Enough mine, one 6-foot body of high-grade ore has been found, and another 5 feet wide. The ore averages about \$40 per ton. —The Little Giant is 300 feet deep and has a pay chute 2 feet wide of good grade. —At the Iola extraction of ore is progressing satisfactorily. Thirty-five men are employed, and the mill is running night and day. The Iola ledge has 5 feet of ore that will average \$60 per ton.

The tunnel on the I. X. L. near Boise will be driven 500 feet farther this winter.

Unwatering the Checkmate will begin soon. —The Challenge mine has a 2-stamp mill in operation. —Seven men are employed on the Birthday mine. —The Pass M. Co.'s property at a depth of 400 feet has found a vein of considerable value. The drift shows ore for a length of 70 feet and a thickness of 6 to 18 inches of shipping grade. —Controlling interest in the Camas No. 1 group, on the Hailey gold belt, has been sold to a Chicago company.

H. Lime has bought the old Cooper diggings in Stanley basin, Custer county, and began moving machinery to the ground for a steam dredge. The ground is said to average 40 cents per cubic yard. —F. W. Bacon, receiver of the American D. & M. Co., filed in the U. S. Court last week his report of the operations at Gibbonsville for October. There was produced plate bullion \$8624.65 and 78.60 tons of concentrates, estimated at \$2447.60, making a total product for the month of \$11,072.25. The costs exceeded the net earnings by \$832.30. —Near Atlanta the Yuba mine and mill, which employed a large force since spring, closed for the winter, but will start up early next season with an increased force and new machinery. —From Osburn a carload of high-grade ore was shipped from the Yankee group and one from the Mineral Point. Near Osburn most of the properties are almost exclusively silver. —Near Kendrick the Mascot M. Co., in the Pierce district, has struck ore of which a mill test of forty tons netted twenty-seven and one-half ounces gold. Work has begun on a 200-foot tunnel, which will open up a large body of ore. The milling capacity is forty tons daily. —The Tiger-Poorman mine on Canyon creek in the Coeur d'Alenes has a vein of silver-lead in which the ore chute is about 1200 feet long. The mine employs about 175 men and is shipping 1500 tons of concentrates per month. It has given employment to from 150 to 175 men for the past ten years. —At Murray H. L. Phillips, who has a bond on the Darling properties in the silver-lead belt, shipped two carloads of carbonate ore to the Selby Smelting Co. at San Francisco, they having made a good bid for the ore some time ago.

Mullan Citizen: The Hecla mine near Mullan shows 7 feet of ore that runs 65 per cent lead and fifty ounces silver. —The Bunker Hill & Sullivan expects to take ore out of the big tunnel next spring.

Challis Messenger: A dredge will be built this winter and put in operation next spring to work the placer mines at Stanley basin. Material is being put on the ground to build this boat. —On Moose creek in Lemhi county the dredge has a capacity of 5000 cubic yards a day and saves 96 to 98 per cent of the gold. —The Clayton M. & S. Co. at Clayton closed the smelter on the 10th inst. for the winter, after a successful run. The mines have been reduced to their usual winter force.

Florence Miner: The Hiyu mine at Florence has resumed and is working fifteen men. The mill will start up soon. —Work at the Blossom mine is going ahead rapidly. The mill is running steadily.

Boise Statesman: The dredges at Idaho City and Pocatello have closed operations for this season, but they ran long enough to demonstrate that they are paying. Work is still going on on two at Centerville. Two

more will be built at Idaho City as early as the weather will permit next spring. —The Pheasant mill at Pioneer has closed down until the snow is deep enough to prevent slush ice from running in the ditch that furnishes water for power. —Near Grimes Pass, a Texas company is developing a good ledge. A shaft is down over 200 feet and drifts are being run. It is announced that a mill will be erected next spring. —The Lucky Boy mill, in Gambirius district, started up recently. Five more stamps will be added, and it is the intention to add more next spring, so that the low-grade ore can be worked at greater profit. —The Stephens Bros. will develop their mine all winter. —The Twin Springs Co. have closed down the Bear Run placer claim until spring. —A San Francisco company is grading for hoisting works on the Basil mine near Centerville. They will put a shaft down 400 feet.

De Lamar Nugget: The following is the report of the De Lamar M. Co., Ltd., for October: Leached 5082 tons. Bullion produced from cyanide treatment, \$37,405; clean-up from pan mill, \$7550; estimated value of ore shipped to smelters, \$500; miscellaneous revenue, \$55; total, \$45,510; miscellaneous expenses, \$33,500; profit for month, \$11,950.

Emmett Index: E. H. Robb's mine is turning out good coal. They are not able to supply the demand at \$4 a ton on the dump.

MONTANA.

At Helena the Superior Court last week granted petitions to A. J. Shaw and F. B. Grinnell, receivers, respectively, of the First National Bank and the Spokane Savings Bank, to accept final payment from Clark & Sweeney for the bond and stock of the Last Chance M. Co., in the Coeur d'Alene, Idaho, district, which they bought from the receivers and on which several payments have been made the past year. In accordance with the order of court, Sweeney paid \$48,839.33 in full settlement. Of this sum \$39,344.70 goes to the First National Bank, and \$8,494.63 to the Spokane Savings Bank. The banks held 225,200 bonds of the Last Chance Co. and 97,108 shares of the stock as security for loans at the time they failed. Clark & Sweeney undertook the purchase of the bonds and stock, and have paid in all, interest included, about \$130,000 for the property. In addition, they have bought up other bonds and stock of the Last Chance until they have secured all but 8000 of the 400,000 bonds, and all but about 45,000 of the 500,000 shares of stock. They recently closed a deal with the Prickett estate of Edwardsville, Ill., for \$63,240 worth of bonds and 30,000 shares of stock. These transactions of late have been in behalf of the Empire State Idaho M. Co., which was organized last spring in New York City, and which now owns and operates the Last Chance mine, and includes in its assets all the surrounding claims. Clark & Sweeney are largely interested in the company, which has been a dividend payer almost from the day of its organization.

At the Queen of the Hills mine at Nelhart a concentrator will be built next spring. —The Moulton M. Co. at Great Falls contemplates building a concentrator early in the spring.

At Nelhart fifty-five men are leasing on Broadwater ground. In October they shipped 200 tons of ore. —At the Big Seven fifty-five men are employed.

The Big Seven mine at Nelhart is becoming more of a gold than a silver mine, though the silver is very high grade. The mine is down 1085 feet. —Dwyer Bros. are developing a property in the same locality.

G. Phelps has bonded the Empire mine near Livingston for \$55,000 and further development will begin at once. —From the mines at Bear Gulch M. Co. sixty tons of ore are being taken out daily. Between thirty and fifty men are employed. —Near Stevensville Ellis & Co. have a gold-bearing vein which increased in width from 1 foot at grass roots to 5 feet at 57 feet depth and assayed from 75 cents at uncovering to \$52 at 50 feet. —Near Winston the East Pacific is building a flume preparatory to putting in an electric plant that will produce 400 H. P., part of which will be utilized at the mine. The new bunk house will be heated by steam and lighted by electricity. —At Nelhart the Galt mine has started up and men are cleaning out the property. —The Florence is shipping twelve cars of ore per month. It employs forty-four men. Only the richest ore is shipped. —Fifty-five men are leasing on Broadwater ground. Last month they shipped 200 tons and this month the output will be greater. —At the Big Seven fifty-five men are employed. —A concentrator will be erected at the Queen of the Hills in the spring and more men will be employed; twenty-eight are now at work. —The Moulton will erect a concentrator in the spring.

The debts of the old Golden Sceptre mine at Quigley have been covered by issuing 10-year 6 per cent bonds for \$500,000, and it is believed the new company, the Majestic, will resume operations next spring and complete the extensive work inaugurated. There is a mountain of low-grade gold ore and over \$300,000 had been expended in the mine and on a plant when the eastern stockholders refused to furnish more money and work ceased.

Libby News: At Sylvanite the Yankee Girl and Juliet are worked as one property. Three tunnels run on the Yankee Girl and Juliet will aggregate about 1000 feet. —Jim Hill has over 500 feet of work done on it, and is considered one of the coming big mines of the camp. Development work will continue this winter. The Jim Hill is a gold property. —The Eberhart is developed by 400 feet of tunnels. The ledge is 12 feet wide, and the best assay is \$28.75 in gold and silver, principally in gold. —Near Sylvanite is the Montana, a silver-lead property, on which the ledge is 16 feet wide, and there are 4 feet of concentrating ore which will average \$28. —In the Friday mine the development consists of 500 feet of tunnels and a shaft 150 feet deep. The ore is free milling and high grade. —In the B. &

M. the ledge is 14 feet wide and runs \$24.85 in gold.

Libby News: There have been more men at work on the placer mines of Libby creek this year and less gold taken out than in any previous season. The cause is that most of the men were doing development work, opening claims in better shape than ever before. Next year will witness an increase of interest in placer mining in this district which will keep an even place with the greatly stimulated activity in quartz mining. The development work done at the Hydraulic placer mines by Capt. Leavenworth will lead to extensive operations in the spring. The work done by the South Bend & Montana M. Co. has been satisfactory to Nicar & Co., who have returned to Indiana, and will be back early in the spring to mine on a much larger scale than heretofore.

Whitehall Zephyr: At Twin Bridges work on the new smelter is moving along, and, the weather permitting, the plant will be completed Jan. 1st. The capacity will be 100 tons per day. It will have two stacks, and its promoters think it will handle any ores except those containing a valuable percentage of copper. Receiver Bacon of the American D. Co. has asked permission of the court to put some of the properties of the company into operation, and for two weeks a party appointed by the court has made an examination of the Golden Sunlight properties near Whitehall.

NEVADA.

The Golden Eagle Co. in Central mining district, Humboldt county, has a shipment in transit of \$100 per ton value and will repeat this at short intervals throughout the winter. The latest strike is between 5 and 6 feet of ore, samples from 2 feet of which yield \$20 in gold. In the lower tunnel a vein was found at a distance of 315 feet and at a depth of 220 feet, showing from \$1 to \$18 in gold. The Ophir Co. in Humboldt county has driven its tunnel 350 feet and has found ore that shows \$30 per ton in gold. At Lovelock it is reported that J. H. Thies has bought the sulphur mine at Rabbit Hole for \$21,000. The North Mountain M. Co. at Eagan canyon has made its last clean-up of auro-cyanides for the season and closed down for the winter. Supt. Eager's first report of work in the Occidental at Virginia shows 12 feet of ore of milling value developed on the 450 level.

Hawthorne Bulletin: Two carloads of ore from the Holmes mine were shipped to Virginia last week for a mill test.

The King Solomon sulphur mines at Rabbit Hole Mountain are producing good sulphur. A large body has been struck of high value. Sulphur has been found in thirty different places in the mines. A \$2500 bar of bullion was shipped from Olinghouse canyon last week. About 230 sacks of gold ore, weighing 25,000 pounds, were shipped from Weiser last week from the Placer basin mines, owned and operated by Jackson & Taylor, to the sampler works. If this shipment for a mill run shows satisfactory results a mill will be built on the property at once. Placer basin is in the Seven Devils district, but the mineral characteristics are different.

At Pioche the Yuba mine is reported producing good concentrating ore. At White Pine, Cannon & Co. of Salt Lake City are sinking a shaft on Teacup group and will erect a hoisting plant in the spring. In the North Mountain Co.'s mine in the spring the tunnel 1200 feet long will be retracted. A carload of ore from the Golden Eagle mine in Central district was shipped from Winnemucca to Salt Lake last week.

Austin Revelle: J. F. Mitchell bought from T. J. Bell the Superior and Gold Belt mines at New Pass and has made the first payment. He has also made a payment on the group of mines belonging to Ryan, Sutton, Murphy & Co., the second payment to be made in sixty days. The mines are gold bearing and the ledges large and the ore free milling, with ore in sight to keep a large mill running for years.

Virginia Enterprise: The overhauling of the machinery of the hoist plant at the C. & C. shaft at Virginia is completed and steam was turned on last week to strip the pump compartment of superfluous material to have it ready for the installation of the Risdon hydraulic plant. The C. & C. shaft is in good condition and but slight repairs will be required. The Pelton wheels on the four stations of the shaft, placed there as part of the water power wire cable transmission plant, will be utilized to operate compressors for furnishing air to ventilate the openings when mining below the Suto tunnel level is resumed. Mgr. Ross says that the installation of the Risdon plant will be completed and water lifting begun Jan. 1st. The survey of the Suto tunnel by Civil Engineer Haist is completed. He found the tunnel in good condition and little variation in the grade of the drain flume has occurred, the excavation made to receive it being for the most part in hard rock. He says that the flume is in better condition than he expected to find it. It will be ready to receive the water when the hydraulic plant is installed.

Virginia Chronicle: The Justice M. Co. at Virginia resumed work through the Woodville shaft this week. The new mill of the company is located close to the hoisting works. T. J. Barbour, R. S. Moore, J. Harrower and G. H. Evans, representing the Risdon Iron Works Co. of San Francisco, this week descended the C. & C. shaft with Mgr. Ross to the Suto tunnel level to look over the situation preparatory to installing the Evans hydraulic pumping plant. The shaft is in good condition and everything is ready for lowering the material for the plant when it reaches here. The installment of the plant will be completed and water lifting begun before the time specified in the contract, Jan. 1, 1899.

The new mining camp of Searchlight in Lincoln county, discovered last May, made a recent ore shipment that yielded \$77 a ton. The Bulldog Gravel M. Co. in Lyon county has its new pump in place and water

is taken out at the rate of sixty gallons per minute. The operators have a streak of good gravel and are taking out about \$4 per day to the man; there are four of them in the company.

NEW MEXICO.

The Good Hope Bonanza M. Co., at Hillsboro, contemplates building a mill. At Bland, mining men guarantee a daily output of 500 tons of ore if the proposed railway is built to Bland.

The Richmond mine at Hillsboro made a shipment of seventy tons of high grade to the reduction works last week. The Andrews cyanide mill is treating thirty tons of Trippie mine ore per day. The Snake mine, at Hillsboro, shipped sixty tons of high-grade ore recently. The Iron Duke mine, in Taos county, shows a body of ore 30 feet thick. The Ace 40-stamp mill at Baldy has started up. The Opportunity mine leasers shipped from Sierra county last week 121 sacks of ore, which netted them \$640. The Monte Cristo M. Co., at Golden, operating a dredge and dry washer, are putting in a pump to use the water over again, and keep the machinery going day and night. The Old Abbe's shaft, at White Oaks, has reached a depth of 1100 feet, and good ore has been uncovered at every level. The company is putting in a plant to catch the gold escaping the batteries.

Silver City Enterprise: A car of iron ore per day is shipped from Legal Tender Hill mine at Silver City. From Pacific mill tailings, in 364 days, were concentrated 18,827 tons. The concentrates and slimes shipped to the Reduction Co. were 5707 tons. The metal contents were: Gold, 1907 61 ozs., at \$20 per oz., \$38,152.20; silver, 50,663 ozs., at 58 cents per ounce, \$29,567.14; copper, 250,738 lbs., at 11 cents per pound, \$27,580. The Pinos Altos G. M. Co. has 100 miners and timbermen employed in several properties. Development on the mines is proving the veins to be valuable.

The management is developing ore reserves to supply a mill of large capacity, to be erected. Ruthenberg & Newcomb have leased the Hudson and Thomas mines near Pinos Altos. These properties have large bodies of lead ore developed which is too low grade to stand transportation. A smelting plant will be erected at the mine. At White Signal J. M. DeKiersey has opened an 18-inch vein of ore on the Black Swan mine, which runs 14 per cent copper, 1½ ounces gold and 19 ounces silver per ton. Fritter & DeKiersey are operating a new turquoise property in this district. At Hanover, Brockman & Hughes made a 10-ton shipment of copper ore from the Hanover No. 2 mine. The Mineral Point Zinc Co. has twenty miners employed and is shipping twelve cars of ore per month to the company's works at Mineral Point, Wisconsin. M. Ruthenberg has taken a lease on the mines of the old Valverde Co. and has a force developing the ore bodies. It is probable that a concentration or lixiviation plant will be used to recover the copper.

At Santa Rita J. B. Gilchrist has twenty-five men employed on his leased properties, the Guadalupe, Chino, Oxide, Robert E. Lee and Yosemite mines. E. W. Clark has twenty men employed on the Cortez mine, which he is working under lease. It is a copper property. McLaughlin & Curtis have eight men on the Montoya claim. They are taking out pay ore. Dawson & Jones have ten men on their lease on the Rita mine and are taking out good copper ore. At Mogollon the Confidence mine has eighty men employed in development work, and taking out ore on which the company's 30-stamp mill at Whitewater is kept busy turning out gold and silver bullion. The company has installed an electric power plant at the mine.

OREGON.

Near Blue Mountain, the Golden Giant dredger will be ready to operate Dec. 1st. Its capacity is 2000 cubic yards per day.

J. W. Howard, near Paisley, Lake county, has quartz ore assaying \$60 gold.

Baker City Epitaph: Near Baker City, the Deer Lodge, Oregon Clipper and Yankee Jim mines were bonded for two years for \$100,000, on which \$15,000 was paid down. The investors are Philadelphia people. They have already begun preparations for work on the Deer Lodge mines. Within a short time twenty-five men will be at work on a 3000-foot tunnel and crosscuts.

Baker City Republican: Cox & Slade will open up placer ground near Buckland station for the spring run of water. J. F. Bachthaler of Portland, owner of the Ollie Woodman mine, will resume work soon. At Golconda, progress is made on the bromine-chlorine plant. It will be finished shortly after Jan. 1. It will treat ores of a refractory nature, and cause the resumption of work on claims hitherto considered worthless.

Jacksonville Times: Cook & Howland, near Jacksonville, have their mines ready and will make a big run if water does not fail them.

The Black Channel M. Co.'s property on Foote creek has been leased by J. P. Lee, who is operating with a strong force. It is locally reported that a strike has been made on the Applegate. The Gold Key Co., operating the Braden mine, is sinking a well to obtain water to operate the mill.

The Sterling M. Co. has finished its clean-up for 1898, which was good, and is making preparations for next season's run. The Gold Standard M. Co. will erect a concentrator soon; they have a large quantity of base ore on the dump. The free milling quartz which has been worked paid well. The Isabella M. Co. is pushing work on their property near Glendale. The company was organized last October and began work immediately. They have ordered a 10-stamp mill, which will be in operation soon. They are building a dam across Cow creek and will bring water two miles through pipes and flumes.

Baker City Republican: Jackley & Turner are rushing things at the No Good mine near Cornucopia. This is the mine from which was recently milled twenty tons of ore netting

\$1000. The C. M. O. Co. is now milling another lot from this property. The ledge is about 5 feet wide. The C. M. O. Co. has struck two ledges in the Union mine, one about 5 feet and the other 16 feet wide. M. Beers is developing the Flag Staff. He has a ledge assaying over \$100 a ton. At Susanville Mount & Co. made a good strike last week of a ledge about 1½ feet wide. The Urie dredger on John Day river, near Sumpter, is working in a satisfactory manner and if the weather permits will run all winter.

Grant's Pass Mining Journal: W. Greder of San Francisco bought the Young copper property near Waldo. He represents a company and will put men at work immediately to developing the property. A strike is reported from the Golconda mine near Baker City of ore ranging from \$30 per ton upwards. There are 1500 tons of good grade ore on the dump. The plant will be finished about February next and will cost over \$100,000. Brown & Graham of Denver have bonded the Don Juan and begun operations. In the Collateral in crosscutting they struck a 5-foot ledge of high-grade ore. Ten tons of ore, with twenty more on the road, were shipped from the Badger mine near Susanville, the average value being \$110 per ton. At the Congar mine a vein of silvanite was recently discovered assaying \$180. A shipment of ore netted \$60 per ton. A. Hansen's mine, the Deer Lodge, was recently bonded by J. Larkins of Spokane for \$100,000, and \$15,000 was paid down. In Coos county a California company is putting up a mill, expecting to operate it this winter. The Myrtle Point M. & D. Co. has several hundred tons of quartz near the mill that will average \$15 in gold per ton. The placer miners are ready for a winter's run and will begin as soon as rains come. There were some good cleanups at the headwaters of the Coquille and Sixes rivers during the summer.

Baker City Democrat: At the Virtue mine near Baker City thirty-eight men are at work. M. Baisley in the Carroll B. mine, in Mabel district, struck a ledge 2½ feet wide with a rich pay streak running through it. C. G. Wheeler is developing a property on option in the interest of Eastern capital. The Phoenix mine in the Robinsonville district was sold last week to Geiser & Hayes for \$27,500. The new owners will probably erect a mill and prosecute active development work on the Phoenix next spring. In the meantime the ore taken out will be crushed at the Pyx mill two miles from the Phoenix mine.

Ashland Record: The dredging company operating near Tolo has closed down for the winter. Sixteen men were employed. The returns are said to have been satisfactory. The last day's work cleaned up twenty-one ounces of gold. The owners of this plant will erect another, somewhat larger, in the spring to operate near Grant's Pass. B. T. Wyant & Sons, who operated the Anderson placer mine near Ashland with success last season, have again leased the same, and last week began a run of nine months. The two river mines operating in Klamath river below Henley quit last week for the season. The American Bar has been operating since last February their day and night crews being thirty men. J. Weininger, who has a wind-dam near Henley, has been at work with a force since May. He will begin work on his placer mine near Fool's Paradise for the winter. Kubli Bros. made a short run of ore through their 5-stamp mill at their Golden Standard mine and realized \$1500. J. P. Lee has leased the Black Channel mines near Gold Hill and began operations with a large force last week.

Ashland Tidings: The Vindicator Placer M. Co., on Wolf creek, will put in what is said to be the largest dam in the State. Its dimensions will be 50 feet high, 250 feet across the top and a depth of 25 feet. Douglas and Josephine counties report great activity in mining, unprecedented in their history.

Baker City Republican: J. H. Cradlesbaugh has bought a half interest in the Imperial group of mines, six in number, in Grant county, near the Baker county line. The upper tunnel is in 270 feet on the ledge and has cut a pay chute for 70 feet. The chute is from 3 to 4 feet wide and twelve tons of ore from it milled \$17.30 a ton. Where the ledge crosses the creek, 1000 feet below the tunnel, it is nearly 100 feet wide and the ore runs \$10 per ton.

SOUTH DAKOTA.

Deadwood Times: The greatest clean-up on record at the Holy Terror mill last week, after a six days' run, was \$70,000. This means \$7000 for each of the ten stamps in the six days, or \$166.66 a day. Each stamp will handle approximately four tons of ore a day, and these figures show the average value of the ore to be nearly \$900 to the ton. At Keystone, R. M. Maloney bought a five-ninths interest in the Egyptian No. 1, No. 2 and the N. Pope and all of the J. R. D. West Star and Gold Link properties for \$60,000.

UTAH.

Shipments from Tintic last week were ninety-one cars of ore, twelve cars of concentrates and twenty-nine bars of bullion.

The Cleveland M. Co. at Mammoth will begin prospecting the ground Jan. 1. A carload of high-grade ore from the J. Bowers at Diamond was shipped last week. Work has started on the Crown Point at Bingham.

The main incline at the Mercur mine is being equipped with a gasoline engine and hoister that will be the largest of the kind to be installed at Mercur with a capacity of 1000 feet. The Godiva mine at Eureka has ore over 50 feet wide and shipments will begin with the new year. It is likely that a mill will be erected next season. J. McChrystal is Supt.

The Star M. Co. near Bingham made its initial shipment of auro-cyanide. Operations at the Sunshine are to be resumed.

The properties of the New Mammoth at Bingham are showing \$14 in gold and an ounce in silver per ton from an 8-foot vein. At Park City it is reported that resumption of work on the Daly West properties will soon begin. At the Ontario the reopening of the mine will be upon a large scale. Work has begun on the Frankie group at Tintic and will be continued through the winter. From the Red Wing at Bingham another high-grade ore shipment has been made and two carloads of concentrates have been delivered. The shipment from the Red Wing showed 118 ounces silver, 18 per cent lead and 5.6 per cent copper. The Mercur mine turned over 1175 pounds of auro-cyanide to the sampler last week.

The sale of the War Eagle property, comprising eight claims adjoining the Silver King mine at Park City, owned by H. Newell, I. J. Hall and others, and which was bonded to the Silver King Co. sixteen months ago, and \$3500 paid at the time, was completed last week by the payment of \$47,500. M. Soh, Salt Lake City, has contracted to furnish European customers with 700 tons of antimonial ore, the percentage of the metal to be not less than fifty per ton. He says he is authorized to contract with miners producing antimonial ores, agreeing to pay for all consignments so soon as loaded on the cars.

The shaft on the Mammoth at Tintic has reached the 1800 level. From the recent strike on the 600 level assays last week from several samples gave 18.8 per cent copper, 282 ounces silver and some gold. The three cages are kept busy every hour of the twenty-four.

The Grand Central mine at Mammoth output last week 250 tons, and for the month it will exceed 1000 tons. The ores are maintaining a good average. Ore of an average of 10 per cent copper is taken from the Boston Consolidated at Bingham. At the Eureka Hill mill, Tintic, with forty stamps dropping, in October the management shipped sixty-four bars of bullion containing gold and copper, and with sixty stamps now in operation Mgr. Hilton expects eighty bars for November.

Three shipments of high-grade ore were made from as many Alta producers last week.

Mercur Mercury: In the Raven at Mercur good ore has been found. The semi-monthly shipment of cyanides was made from the Mercur mill last week. It weighed 1200 pounds. A shipment of cyanides from the Geyser-Marion reached Salt Lake last Saturday. The Daisy made another shipment of cyanides last Saturday, which was large and valuable.

A shipment of ore was made by the Argent last week and it is the intention to make shipments regularly through the winter. Galena has been found in the Shamrock mine at Stockton on the 450 level. It is said that Mitchener & Colbath have taken \$5000 worth of ore out of the Honorine. A shipment of high-grade cyanides was made by the Chloride Point at Mercur last week. The Columbia is yielding good results. A shipment of high-grade ore was made last week which yielded 40 per cent lead, seventy ounces silver and \$3 in gold per ton. In the Antler a vein 2½ feet in thickness has been found showing \$7.60 in gold and five ounces in silver. The Northern Light has opened up large bodies of ore, carrying from 300 to 500 ounces of silver per ton. The ore is being sacked for shipment.

Mercur Miner: Work has begun on the Cedar Hill group of claims recently bought for \$40,000, by Mayne & Cary. They have sold a portion of their interests to Indiana people and will develop the property as rapidly as possible, expecting to erect a mill early next spring. At the La Cigale the shaft is down 860 feet. A body of ore is blocked out ready to be hoisted as soon as the roaster is completed, which will be soon.

Park City Record: The Massachusetts near Park City is pushing a drift from the 600 station. Twenty-five men are at work. The Clarissa broke into the ledge last week and found a vein 5 feet wide. Men are incising the 700 feet of tramway from the Silver King hoisting works to the new mill, and a large force is employed placing the mill's new machinery, which will be ready about Jan. 1.

Bingham Bulletin: A 100-ton lot of concentrates was shipped from the Dewey mill at Bingham last week, the first product of the 2000-ton run being made on second-class from the Old Telegraph dump. Nelson & Richardson have started work in the lower tunnel of the Daylight lode. Work is being pushed on the Ophir mine by W. A. Robertson & Co.

Three carloads from the Landmark & 89 were shipped last week. It is locally reported that a fifty-ton concentrator will be built for the Old Telegraph mine and Mgr. Lavagnino hopes to have the plant running before winter is over. In the St. Joe M. Co.'s group, comprising ten claims, the Ublig tunnel No. 1 is being run for development. This tunnel is in 500 feet. Assays of \$20 in gold are obtained. At the Boston Consolidated, in the 600-foot tunnel, a 4-foot vein has been uncovered, the average value being 8 per cent copper and from \$3 to \$6 in gold to the ton. The Starlus mine is down 180 feet.

WASHINGTON.

C. Burns is developing mining properties near Darlington which are showing well. Price & Dickson's Blue Bird claim gives assay returns of \$50 in gold and 10 per cent copper. At Republic, in the Lone Pine, drifting continues in pay ore. Values run \$65 in gold and the general average for last week was \$20. The ore body is 14 feet wide. At Republic the ore in the Golden Harvest is 3 feet wide and of good values. The Merrimac shaft has found quartz of fair grade. Supt. Harvey of the Republic mine will soon start work on the Lone Pine. In the San Paul the ore body is growing. The Reindeer G. M. & M. Co. continue work in the tunnel. The group comprises three claims. Surface work has exposed the ledge for 2000 feet and assays range from \$4.13 to \$6.54.

On the Iron Monitor work is progressing. The tunnel is in 115 feet.—Work on the Pocahontas is being pushed.—The Eureka Queen tunnel is being driven on, while the quartz shows well.

WYOMING.

It is locally reported that Haggerty & Deal, part owners of the Rudefeha copper property at Battle Lake, have sold their interests for \$70,000, with \$10,000 down, the balance in six and twelve months. The ore assays 62 per cent copper and \$18 in gold.—G. Doane, owner of the Rambler, is pushing work on his claims and will soon begin shipments again.

FOREIGN.

BRITISH COLUMBIA.

The B. A. C. began development of the Le Roi last Monday.—Shipments from the mine will continue at the rate of 200 tons per day. The force will be kept at about 250 men, and as soon as conditions will justify shipments and miners will be increased. The ore will go to the company's smelter at Northport. Now that the company is in possession of the Le Roi the development of its other properties will be pushed and fifty or sixty additional men will be put to work on the Columbia-Kootenay, the Nickel Plate, the Great Western, the Josie and the No. 1. That will make the corporation's payroll about 450 men per month.—The Minnehaha near Cariboo has sold \$32,000 of treasury stock in Toronto, to continue development of the property, on which about \$18,000 has been spent.—The Fontenoy has been sold to Greenwood and Vancouver people, who had it under bond for \$32,000. It is said that the new owners will undertake development work at once.

From Kaslo the ore shipments for last week were 232 tons.—T. McDonald of Camp McKinney last week sold to A. C. Jamison the Annie L. fraction in that camp. The price is not made public. Mr. McDonald receives a considerable sum in cash and retains 225,000 shares of stock.—The Eureka, owned by Standard Oil people, has been developed to the extent of \$28,000.

The Spokane Review learns that the Turner combine will receive between \$3.25 and \$5.50 per share for their Le Roi holdings. Under the terms of the agreement with the B. A. C., it will be recalled, they are to receive \$7.25 in money and the cleanup of all the ore on hand at the Northport smelter. At the time the contract was signed there were about 17,000 tons of ore on hand. It was agreed that the Turner people should have the use of the smelter for the treatment of this ore, and it was further agreed that the B. A. C., if it so wished, should have the option of sampling the ore and paying the Turner people its cash equivalent.

Rossland Miner: The ore shipments from Rossland for seven days ending Nov. 19 were 4623 tons. Shipments for same week last year were 1635 tons. The total shipments from the camp since January 1, 1897, aggregate 185,511 tons.

At Fairview, at a general meeting of the Tin Horn, Comstock-Mammoth and Winchester companies, an amalgamation of the three was decided upon. A new company is to be formed with a capital of \$1,000,000, the property of which will consist of the Tin Horn properties, including the mill and the mining claims of the Comstock-Mammoth Co. and the Stemwinder mine, upon which a large air drill plant and hoisting machinery are operated; the Fairview townsite, the charter and franchises of the Fairview Power Co. and the coal deposits on the Penticton road. The first object of the new company will be to push further development on the Stemwinder, and to install additional machinery and erect a mill capable of treating the ore in large quantities.

LOWER CALIFORNIA.

A good strike was made in the mines of the Ibarra G. M. Co. at Calmali at a depth of 600 feet. The owners of the mines are San Francisco men.

W. R. Farnsworth, near Escondido, is meeting with success in the Dewey mine. The ledge is of fair size and good value.

MEXICO.

F. Lohrs bought one-fourth interest in the mines near Suagui Grande, Sonora. It is a producing property.—Unwatering the Ahogado mine is progressing and the old workings are partly accessible.—Near Matape, the Sonora M. & D. Co. have opened in their Money-maker mine a 2-foot ledge of free milling gold ore which goes \$21 per ton. They ship ten miles to a mill.

La Campana gold mine near Sasabe has sixty men employed and keeps a 10-ton stamp mill running night and day, crushing 600 tons of ore a month. Most all supplies for the mine are sent via Tucson and all bullion is shipped to Tucson through the Sasabe custom house. The tariff tax at Sasabe is 7 per cent of the bullion value.—J. B. Haggin is pushing development on a mine near the Campana mine. The water problem at the latter property was solved by sinking a well four miles from the mine and piping the water.—Chicago capitalists are developing a property near the La Campana mine.

Two Republics: Grant, Congell & Co. near La Colorada, Sonora, on cleaning out an old mine the property proved to be valuable, and they are shipping ore carrying \$16 gold and \$300 silver to the ton, with a good percentage of lead.—A. Fowler, owner of the Surprise-Tunnel mine near Chuichupa, has a body of

high-grade ore and will ship soon. He must pack his ore eighteen miles to Chuichupa, whence it will be sent by wagon ninety-two miles to Casas Grandes, thence by railway to El Paso.—At Coahuila a company has been formed to exploit recently discovered gold mines in the Carmen mountains, for which machinery has been ordered, and the mines are to be worked on a large scale.—At Parral, Chihuahua, the Mexican Railway has built a 50-mile branch, which has induced companies to purchase some of the old mines that have been idle for years.—Stalforth Bros. are running their 30-stamp mill day and night and the Jesus Maria will start up soon with a new set of pumps and will build a large concentrating plant.—J. J. Long has surveyed a road from his mines to a tract of timber land sixty-five miles from Parral, to furnish wood and timber for his mines.—The antimony deposits near Catorce, in the State of San Luis Potosi, are to be worked by a company.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 23, 1898.

614,792.—ADVERTISING ARCH.—Dodson & Archibald, El Monte, Cal.
614,712.—INK WELL.—J. T. Forrest, Chehalis, Wash.
614,655.—BUILDING BLOCKS.—H. F. Ingerson, Alameda, Cal.
614,664.—GAS GENERATOR.—Mace & Keough, Oakland, Cal.
614,746.—OVEN.—Oberfeld & Braunbeck, S. F.
614,747.—AX.—O. Ohlson, Seaside, Oreg.
614,511.—WINDOW SCREEN.—R. M. Spencer, S. F.
614,675.—SEWER GATE.—S. S. Tilton, S. F.
614,676.—BICYCLE BRAKE.—R. G. Tucker, La Grande, Oreg.
614,779.—SASH BALANCE.—O. Vannorine, Los Angeles, Cal.
614,640.—AUTOMATIC LOADER, ETC.—G. M. Wheeler, Tacoma, Wash.
614,524.—GAME.—J. O. Yardley, Stockton, Cal.
23,724.—DESIGN, MONUMENT.—T. J. Owens, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

ACETYLENE GAS GENERATOR.—A. F. Mace, Stockton, Cal., and L. R. Keough, Oakland, Cal. No. 614,664. Dated Nov. 23, 1898. This invention relates to an apparatus which is especially designed for the generation of acetylene gas. It consists in the novel arrangement of a carbide-containing tray and in a novel method of removing the ash or residue while the carbide of calcium is being used inside of a gas-tight cylinder or other receptacle. The object is to provide an improved means for obtaining acetylene gas from carbide of calcium, and to effect a sufficient disturbance or reversal of the carbide of calcium which is held and used in the gas-tight compartment so as to quickly and efficiently remove the ash, and to adjust the mechanism by which the operation is carried out so as to free the unused carbide of the ash which accumulates, and in regulating the supply of water by the movement of the gas produced. It consists of a cylindrical chamber with means for introducing the carbide of calcium in charges, a perforating tray or holder fixed across the interior and forming a support for the carbide, a spray pipe turnable with the cylinder and through which water is delivered into the upper part of the horizontally journaled cylinder so as to discharge upon the body of the carbide, and mechanism by which the cylinder is oscillated upon its journals so as to alternately tilt the containing tray to an angle upon either side, whereby the mass of carbide rolls and shifts its position so as to lie within an angle formed between its support and the inner wall of the cylinder. A small rising and falling gasometer is interposed between the generator and the main gasometer, and is connected directly with the lever arm of a water-controlling cock so that the movements of the gasometer open or close the cock and regulate the supply of water to the generating chamber. The ash which is separated from the carbide is sifted through the perforated tray containing the carbide into the chamber beneath.

DESIGN FOR A MONUMENT.—T. J. Owens, San Francisco, Cal. No. 23,724. Dated Nov. 23, 1898. This invention relates to an ornamental design for monuments for cemeteries. It comprises an essentially rectangular base, with sides and ends inclining inwardly toward the top, said top being also inclined so that one end is higher than the other. The angles of the rectangle are cut away so that the base presents two upwardly converging sides and ends of less length than the sides, these four angular faces connecting the sides and ends. The inclined tablet has the sides formed in the concave arcs, the upper end with straight edges, and the central angular projection and the lower end forming an obtuse convex central angle. The collars of the tablet are cut away to correspond essentially with the angular corners of the base.

Coast Industrial Notes.

—A cable line to the Philippines via Hawaii is an existing necessity.

—About 5,500,000 salmon eggs have been placed in the Fraser river.

—At the Mare Island, Cal., Government Navy Yard 1700 men are busy.

—Fifteen miles of narrow-gauge railroad are to connect Truckee and Tahoe City, Cal.

—The U. S. Government has acquired the Philippines; an outlet for Pacific coast trade.

—The Crow's Nest Coal Co. are said to be trying to secure 500 miners for their mines at Fernie, B. C.

—Sacramento, Cal., proposes to spend \$40,000 in a water supply from the north fork of the American river.

—Victoria, B. C., has a surplus of \$32,223 in the city treasury, \$12,000 of which is to be used for water works improvements.

—The U. S. torpedo boat Davis, at her trial trip at Portland, Or., Nov. 24, averaged 23½ knots per hour. In two hours she made 92 miles.

—Nine miles of the railroad from Golconda, Nevada, to the mines of the Glasgow Co. have been graded and the rails are ready to be put in place.

—Monterey, Cal., gives the Monterey & Fresno Ry. Co. all its water front conditional upon beginning active construction work by Jan. 1st, '99.

—The Seattle, Wash., city council has awarded the contract the Cedar river water works to Gahn & Byone of Chicago for \$1,050,000.

—Packers' rates from White Pass to Lake Bennett are 4½ cents per pound on large shipments and 5 cents per pound on shipments of one ton or under.

—In an oil well under the sea, in Summerland, Santa Barbara Co., Cal., this week, was made a "strike" of natural gas, in large quantity, as yet unrestrained.

—The Blue Lakes Water Co. is building a new power plant at Blue Lakes City, near Mokelumne Hill, Cal. Aluminum will be used for electrical conduction.

—Near Stockton, Cal., on the 27th ult. the steam chest on the river steamer T. C. Walker exploded, killing three employees and three passengers, and scalding several others.

—The yield of dry wines in California this year, it is calculated, will be 8,000,000 gallons. The product last year was 27,000,000. Sweet wines will be about half the product of last year.

—The Los Angeles, Cal., Times says the Santa Fe R. R. Co. has purchased from the Southern Pacific a half interest in all trackage rights between that city and Bakersfield, thus giving Santa Fe its entrance into San Francisco.

—The new U. S. of Central America, composed of the republics of Nicaragua, Salvador and Honduras, which had its birth November 1st, had an area of 110,000 square miles and a population of 2,000,000. Its great importance was due to its coast line and the fact that in it will lie the Nicaragua canal. The tripartite republic, however, went to pieces last week.

—From April 1st to June 30th, '98, the U. S. Government chartered fourteen ships on the Pacific coast, having a total tonnage of 41,152, and carrying capacity of 629 officers and 13,059 men with their complete outfit of camp and garrison equipment, arms, ammunition, medical and subsistence stores for a voyage of over 7000 miles to the Philippines. The payment for service vessels, under charter to June 30th, '98, was \$319,764.

—The U. S. battleship Wisconsin was successfully launched at the Union Iron Works, Potrero, San Francisco, last Saturday. The keel of this vessel was laid February 11th, '98; length, 374 feet; beam, 72 feet; depth of main deck, 34 feet 6 inches; depth of superstructure, 42 feet; draught of water, 23 feet 6 inches; displacement, 11,525 tons; speed, 16

knots; two sets triple expansion engines, indicated H. P., 11,000; high pressure cylinder, 33½ inches; intermediate, 51 inches; low pressure, 78 inches; stroke, 48 inches; revolutions, 120; eight single cylindrical boilers, 16 feet 3 inches diameter by 10 feet long; total grate surface, 685 square feet; total heating surface, 21,205 square feet; steam pressure, 180 pounds.

How Our Export Trade Increases.

The remarkable growth in our exports of manufactures is illustrated by a table just prepared by the Treasury Bureau of Statistics, showing the exports of leading articles of manufacture at ten-year intervals during the past thirty years. This table shows the exports of each class of manufactures whose value exceeded \$1,000,000 in the year 1898, comparing that year's exports with those of 1888, 1878 and 1868, and thus presenting a bird's-eye view of the growth of our leading exports of manufactures during a thirty-years' period.

The total export of manufactures in 1898 was more than five times that of 1868, that for 1898 being \$288,871,449, while that of 1868 was in round numbers about \$60,000,000, expressed in the depreciated currency of that date, and when reduced to the gold standard by which our manufactures are now measured would be less than \$45,000,000.

Thirty-four classes of manufactured articles show an export of more than \$1,000,000 each in the year 1898, while in 1868 only seven of those classes showed an export of as much as \$1,000,000 each. Five classes of articles show an export in 1898 of more than \$10,000,000 each, while in 1898 only one of those classes showed an export of as much as \$10,000,000. Even in 1888, only ten years ago, but seventeen of the thirty-four classes showed as much as \$1,000,000 each in value and but three of them passed the \$10,000,000 line. In these calculations it must be borne in mind that values of nearly all articles are now less than at the earlier dates considered, so that these statements of the exports of great groups of articles, while necessarily expressed only in values, doubtless represent in 1898 a larger quantity for each dollar or million of dollars than in 1888 or 1878, and especially more than in 1868, when the values were expressed in depreciated currency.

Of the important classes of manufactures, those of cotton, leather, wood and iron and steel, present the most striking evidence of growth. Exports of cotton goods which in 1868, even expressed in the currency of that date, were less than \$3,000,000, but in 1898 were over \$17,000,000. Exports of leather, which in 1868 were less than \$2,000,000, were in 1898 more than \$21,000,000. Manufactures of wood, which showed an exportation of \$2,000,000 in 1868, were in 1898 over \$9,000,000. Manufactures of iron and steel which expressed in the currency of 1868 were a little over \$3,000,000 were in 1898 over \$70,000,000. None of the great items of export show as rapid growth as copper, of which the exports in 1868 were less than \$500,000, while in 1898 they were over \$32,000,000. Paraffin, a comparatively recent development in the great petroleum industry, amounted to less than \$50,000 in our exports of 1868, while in those of 1898, amounted to more than \$6,000,000.

That these statements, which show a wonderful growth in the value of our exports do not, because of decreased values in most cases, exhibit the real growth in quantities of articles exported, is illustrated in the single case of refined mineral oils, in which the exports since 1868 have increased ten-fold, while the values as expressed in this table are but two and a half times those of 1868. That it is impossible, however, in a table of this character, to show quantities, is of course apparent, as the great classes considered are made up of so many items measured by different units, that it is impracticable, in an attempt to group these facts in a single table, to do more than present statements of total values by classes. The table is as follows:

EXPORTS OF LEADING CLASSES OF MANUFACTURES FROM THE UNITED STATES IN 1868, 1878, 1888, 1898.

| | 1868. | 1878. | 1888. | 1898. |

NOTE.—Values in 1868 are expressed in currency whose value was 71.5 in gold.

This Paper Fifty-Two Times, POST PAID, \$3.00

Cheaper Way of Sending Circulars.

DURING the recent Miners' Convention in San Francisco it was noticed that some firms dealing in mining machinery issued circulars that were supposed to be distributed throughout the hall; but of that, probably the janitor of the hall who removed the debris could tell better. It is also noticed that some firms in San Francisco and elsewhere now and then get up circulars that they mail, mostly to men who moved from the place a year ago.

It was supposed that everybody understood what a waste of money is always involved in issuing circulars—whether distributed by hand or sent by mail; and while it is evident that those who get out circulars really want to advertise, it is equally evident that they don't know how to get at what they do want. As there appears to be a few (mostly believers in "mining directory" lists) who still think that a circular is a good thing and forget that the circulars that they send out, even when received, are always accorded the same fate that they themselves give to any circular that they receive, namely, throwing it away unread, it is deemed advisable to suggest to them a way in which they can have their circulars do them some good.

To those who have mining machinery for sale, or who want to reach the mining world, and feel disposed to cling to the ancient notion of circulars sent by mail at random to probable or possible customers, it is suggested that they can, without doing violence to their established notions, secure better results in a better way. The following tells them how it can be done, being an illustration of how to do effective circular work at a greatly reduced cost. There are very few circulars that contain more than can be prominently displayed in one page of this paper :

| | |
|--|----------|
| 7,500 good circulars, well printed on fine paper, cost, say, | \$18 75 |
| Envelopes for same, | 6 75 |
| Addressing them, | 5 50 |
| Postage (sealed envelopes), | 150 00 |
| Total, | \$181 00 |

Thus we find that to get 7,500 circulars into the postoffice costs \$181.00. This is on the supposition that the 7,500 names to whom the circulars are addressed are those of men likely to be customers of the concern sending the circulars, which is very unlikely, as no one firm can secure a live list of possible customers that would equal in value a list containing the same number of subscribers of a good live paper that is bought and paid for and seen every week and passed around until in many cases it is worn out from the number of readers through whose hands it goes. Now, instead of spending \$181.00, which is mostly thrown away, how would it do to take the same circular and put it on one page of the **MINING AND SCIENTIFIC PRESS**, the cost of which in place of \$181.00 would be \$42, or less than one-fourth of \$181.00, with a hundred times the greater likelihood of value? The manufacturer or dealer in mining machinery who will spend \$181.00 in an attempt to get his business before 7,500 people, could save \$139.00 by putting that same circular on one page of this paper and be sure to get it before 7,500 definite, known men, thus securing a certainty instead of an uncertainty and at less than one-fourth the cost of the old way.

If a circular is so good a thing as some seem to imagine, here is a chance for them to make money and save money at the same time and to get what they want at very little cost, and in place of firing a scattering shotgun, they can shoot with a rifle and concentrate all their ammunition that way.

In figuring on the cost of these circulars it is assumed that each one is sent sealed, which involves a two-cent stamp; but even were they sent unsealed they would still cost one cent apiece for postage, which would make them cost \$106.00. Herein we show how lovers of circulars can substitute certainty for uncertainty and at far less cost to themselves. The force of these remarks lies in their personal application.

San Francisco, Cal.... **MINING AND SCIENTIFIC PRESS**, 330 Market St.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1) shows a cross-section, and (Fig. 2) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

Company

OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 25 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of 3/4-inch cable. The outfit weighs 3500 pounds.

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675.
Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in
Gold Mills:

One of these machines will
take the place of two or
three belt concentrators of
any style and do very much
better work.

1. It will successfully handle three or four times more material
than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and
catch any float gold, amalgam or quicksilver which may escape
from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus
saving useless expense for transporting valueless material, as
also extra cost for treatment.
4. It requires little or no attention when once adjusted and no ex-
pert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost
of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated
machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of mate-
rial can be worked, which is not true of any style of belt ma-
chine.

— SEND FOR CIRCULARS. —

MA-
CHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction
which make it superior to all others. It is mounted on a sin-
gle solid base, with standboard for the operator. The engines are
reversible link-motion and the drum is fitted with post-brakes and
helical teeth, which assure quick and safe operation. The design
is compact and superior and the construction strong and substan-
tial. We furnish them either with or without clutch pinions. The
above cut illustrates an 8½ inch by 10 inch. Other sizes in stock
and built to order.

Webber Patent Compression Grip

IS USED ONLY ON THE PATENT

Bleichert Wire Rope Tramway,

And Others Manufactured by the

TRENTON IRON COMPANY, TRENTON, N. J.

ENGINEERS AND CONTRACTORS, and Sole Licensees in North America for the Bleichert System.

Also, Wire Rope Equipments for Surface and Underground Haulage, Transmission of Power, Etc.

For Particulars, Address . . .

NEWTON M. BELL, Agent, 109 California St., San Francisco.

A full stock of the Trenton Iron Co.'s Wire Ropes, made from "SPECIAL" Crucible and Plough Steel, carried in San Francisco.

No lugs or knots of any kind required on the traction rope, giving longer service, and saving in repairs. . . .

Illustrated book upon application.

FAIRBANKS, MORSE & Co., SAN FRANCISCO. GAS AND GASOLINE ENGINES

— FOR —

Pumping, Milling, Lighting, &c., &c.

This cut represents a New and Improved Combined Geared Gasoline Engine and Hoist with Friction Clutch, Differential Band Brake, Speed Regulator Indicator, and all appliances found in Modern Steam Hoists.

For Efficiency, Economy and Durability It is Unequaled.

Hoisting capacities from 1150 to 6000 lbs.; cost of operation, with gasoline at 10 cents a gallon, 1 cent per H. P. per hour. Also furnished in friction if desired.

Special Descriptive Catalogue of Engines—Pumping, Hoisting, Electric Lighting, Air Compression.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

**THE
BRYAN
ROLLER
QUARTZ
MILL.**

Is constructed on the principle of the Chill Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade

Our German drawing instruments bear only the trade marks or We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Baragew Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, **KEUFFEL & ESSER CO.**

THE BEST BOOKS

Are always the **CHEAPEST**. All the latest and best works on Mining, Metallurgical, Electrical and kindred subjects can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of Standard Mining Works and Scientific Publications.

MINING AND SCIENTIFIC PRESS,

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....\$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....\$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....\$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....\$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....\$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdies, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....\$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is especially applicable to the Pacific Coast. Price, postpaid, \$2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....\$8 00

The Metallurgy of Gold.

By M. Elsler. Profusely illustrated.....\$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....\$1 50

Quartz Operator's Handbook.

By P. M. Randall.....\$2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....\$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....\$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....\$4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....\$5 00

Assaying GoldAND..... Silver Ores.

By **C. H. AARON.**

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents.—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examination of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price \$1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

Colorado's Mining Industry.

There have been a number of interesting and instructive pamphlets issued on this subject by the U. P. D. & G. Ry. and the South Park Line, Colorado's progressive railroads, which reach the principal mining centers of this vast mineral section. They are all carefully and conservatively prepared and will be mailed upon receipt of request and necessary postage. The various publications are as follows:

- La Belle Gold Fields, 2c.
- Gunnison Gold Belt, 2c.
- Hints to Prospectors, 2c.
- Ward Mining District, 1c.
- Pine Creek, 1c.
- Puma, 1c.
- Breckenridge Gold Belt, 1c.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

SELBY SMELTING & LEAD CO., 416 Montgomery Street, San Francisco.

FRESNO, June 25, 1898.

Hercules Gas Engine Works, San Francisco, Cal.

DEAR SIR:—

The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly,

TUOLUMNE MOTHER LODE M. & D. CO.,

Per N. W. Moody, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

Hercules Gas Engine Works,

405-407 SANSOME STREET,

SAN FRANCISCO, CAL.

Commercial Paragraphs.

THE Jeanesville Iron Works Co.'s Denver office has shipped one of their large improved sinking pumps to the Moon-Anchor gold mines, and a high-lift station pump to Leadville.

THE Gates Iron Works of Chicago, Ill., is in receipt of an order from Australia for nine sets of the Gates Standard high-grade 36-inch rolls, weighing 33,000 pounds each. This order is from a mining company to whom the Gates Iron Works have supplied a number of their large breakers, six having been shipped to them this year.

THE Vulcan Iron Works of San Francisco have recently filled a second order from the U. S. government for a Vulcan ice making plant for the Philippine islands, same being a duplicate of ice making plant now in operation at Manila. The Vulcan Iron Works have equipped the steamer Senator of the Pacific Coast Steamship Co. with a Vulcan ice and refrigerating plant, and are now installing a similar plant on the steamer San Jose of the Pacific Mail Steamship Co. These works are also filling an order for an ice machine for the Indian school at Fort Mojave, and are supplying the Mentone factory of the Union Ice Co. with ammonia fittings, mineral wool, etc., for the extension of their freezing capacity.

THE American Type Founders Co., formerly owners of the Hercules Gas Engine Works, has sold all its right, title and interest, together with patents covering the Hercules Gas, Gasoline and Oil Engines, to W. R. Van Brunt, O. N. Owens and Theodore Poindexter. The buyers have incorporated under the name of the Hercules Gas Engine Works, and will continue the business. It is the intention of the new owners to inaugurate improvements in their plant and their line of manufacture. T. Poindexter is president and manager; O. N. Owens, vice-president and superintendent; W. R. Van Brunt, secretary and treasurer. Messrs. Poindexter and Owens have been identified with the Hercules engines for many years; Mr. Van Brunt is a well-known business man of San Francisco and connected with the Spreckels Bros.' line of steamers. The new company will temporarily continue its offices at 405-407 Sansome St., San Francisco.

Obituary.

SUPT. MILNER of the Dexter mine at Tuscarora, Nevada, died at that place last week of typhoid pneumonia.

A Tour of Old Mexico.

The Gulf Road is arranging for a high-class, personally conducted tour of old Mexico, to start from Denver January 24, 1899. This excursion, which will cover a month, will comprehend all that is of scenic and historic interest in the sister Republic, penetrating far south of the city of Mexico and off the beaten paths of the tourist.

The trip will be by special train of luxurious sleeping cars, observation cars and dining cars for the entire distance, and nothing that might contribute to the pleasure or comfort of our patrons will be omitted.

The party from Colorado and west thereof

will be under the personal charge of the Assistant General Passenger Agent of the Union Pacific, Denver & Gulf Railway.

The cost for this unusually fascinating trip, \$350 from Denver or other points in Colorado en route, is very low, considering that it covers all legitimate items of expense. One could not individually make this trip for twice that amount.

If you are contemplating a trip this winter we should be glad to give you more detailed information and to furnish you with a complete itinerary.

T. E. FISHER, Asst. Gen. Pass. Agt. Gulf Road, Denver, Colo.

Acetylene Gas.

A handsome new illustrated catalogue will tell you where and by whom the new light is being used, and what the verdict is. Mailed upon application. PACIFIC ACETYLENE GAS CO., 115 New Montgomery St., San Francisco.

Assessment Notices.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of November, 1898, an assessment (No. 15) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 24th day of December, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES BUOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1898, an assessment (No. 16) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 30th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. F. HOLLING, Secretary.
Office—113 Crocker building, sixth floor, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1898, an assessment (No. 85) of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 29th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALFRED K. DORBROW, Secretary.
Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1898, an assessment (No. 2) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 218 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 17th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. MIDDLETON, Secretary.
Office—218 Jackson street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 3d day of October, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of August, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, room 57, 916 Market street, San Francisco, California, on FRIDAY, the 25th day of November, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. FLEISSNER, Secretary.
Office—916 Market street, room 57, San Francisco, California.

POSTPONEMENT.

The day of sale of the above delinquent stock has been postponed to MONDAY, December 5th, 1898, at the same place, at 10 o'clock A. M. By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.
Office—916 Market street, room 57, San Francisco, California.

DELINQUENT SALE NOTICE.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Riverside County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 10th day of May, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|----------------------------|-----------|-------------|---------|
| W. H. Bailey, Trustee..... | 260 | 2,000 | \$30.00 |
| W. H. Bailey, Trustee..... | 261 | 2,000 | 30.00 |
| W. H. Bailey, Trustee..... | 262 | 10,000 | 150.00 |
| C. A. Bailey..... | 133 | 1,000 | 15.00 |
| C. A. Bailey..... | 135 | 1,000 | 15.00 |
| C. A. Bailey..... | 136 | 1,000 | 15.00 |
| C. A. Bailey..... | 138 | 500 | 7.50 |
| C. A. Bailey..... | 169 | 2,000 | 30.00 |

| W. H. Bailey, Jr..... | 150 | 1,000 | 15.00 |
| W. H. Bailey, Jr..... | 151 | 1,000 | 15.00 |
| W. H. Bailey, Jr..... | 152 | 2,500 | 37.50 |
| W. H. Bailey, Jr..... | 208 | 4,000 | 60.00 |
| W. H. Bailey, Jr..... | 209 | 522 | 7.98 |

And in accordance with law, and an order from the Board of Directors, made on the 16th day of May, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, Room 508 Safe Deposit Building, San Francisco, California, on TUESDAY, the 1st day of November, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
R. L. CHENEY, Secretary.
Office—Room 508 Safe Deposit Building, San Francisco, California.

POSTPONEMENT.

The day of sale of the above delinquent stock has been postponed to THURSDAY, December 1st, 1898, at the same hour and place. By order of the Board of Directors.

J. W. PEW, Secretary.
Office—310 Pine St., Room 15, San Francisco, Cal.

POSTPONEMENT.

The day of sale of the above delinquent stock has been postponed to THURSDAY, December 15th, 1898, at the hour of 1 o'clock P. M., at the office of the company. By order of the Board of Directors.

J. W. PEW, Secretary.
Office—No. 310 Pine street, room 15, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from the Wintz Mining & Improvement Co., to mine near Pleasant Valley, El Dorado Co.; to deposit tailings on a flat below the mine; from Joel Bean, in the Cleveland Mine No. 2, near Scales, Sierra Co., to deposit tailings in Rock Creek; from J. B. Jones, in the Haskell Valley Mine, near Buck's Ranch, Plumas Co., to deposit tailings on a flat below the mine; from Thos. Gomez, in the Snowy Side mine, near Buck's Ranch, Plumas Co., to deposit tailings in Willow Creek; from N. E. Frills, in the New York Mine, near Buck's Ranch, Plumas Co., to deposit tailings in Willow Creek; from J. C. Horner, in the Chaplain Mine, near Buck's Ranch, Plumas Co., to deposit tailings in Willow Creek; from Llewellyn A. Hoeflich, in the Rocky Bar Mine, near Nelson Point, Plumas Co., to deposit tailings in worked out pits; and from C. W. Ayers, in the Orleto Gravel Mine, near Jamestown, Tuolumne Co., to deposit tailings on a flat below the mine, gives notice that a meeting will be held at room 69, Flood Building, San Francisco, Cal., on December 12, 1898, at 1:30 P. M.

CAPITAL DESIRING TO INVEST IN RICH and Extensive Gold-Bearing Gravel Deposits. Address

JOHN W. GRAY, 923 Linden St., Oakland, Cal.

LUNKENHEIMER'S Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class now upon the market. The body is heavy and well proportioned, the seat is carefully finished and the general workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.

Particular attention is called to the quality of metal used, it being the best gun metal composition. By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

The regular pattern of this valve is guaranteed to stand a working pressure of 175 lbs., but we also make a line of extra heavy valves of this kind to stand pressures up to 350 lbs. All valves are carefully tested and warranted. Specify "Lunkenheim" make. Sold by dealers everywhere.

Write for Catalogue of Steam Specialties.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper" etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Excavation of Irrigating Canals.

The need of irrigation in California, manifested by such serious drought as that of '98, lends interest to the progress in that direction of many large enterprises. A recent one of some magnitude in Colusa Co. attracts attention, because of its extent and the appliances used in effecting results. The main canal for the Central Irrigation District was cut in sections. Herewith is illustrated the excavator used by the San Francisco Bridge Co. in constructing six miles of that canal, 60 feet wide on the bottom, 100 feet wide on the top, and from 10 to 20 feet deep, the average depth being 15 feet. From the bottom of the canal to the top of the spoil banks was 35 feet in some sections. The top soil was loam, the middle and bottom strata hard, cemented gravel and hardpan. This hardpan, as usual, was impervious, and the water table of that section of country for most of the year lay two feet above the bottom line of the projected canal, thus rendering impossible any effort to drain the bed. It was this fact that led to the designing of the machine here shown at work. It will be noticed that owing to the impossibility of supporting it on the bottom of the ditch, because of the water there, the machine is held up on either side by a railway track on the canal banks. The machine as shown has a daily capacity of 4000 cubic yards, delivering the excavated material on each side about 12 feet farther outward from the

EXCAVATING IRRIGATION CANAL, COLUSA CO., CAL.

edge of the banks or sides of the canal. The excavator traveled transverse to the ditch on a car supported by a bridge which spanned the canal, the spoil being carried on each or either side by a belt conveyor. As the machine passed the center, a tilting boom in the hopper delivered the

excavated earth first to one conveyor and then to the other, the whole machine continuing to be carried forward longitudinally with the ditch as dug by means of the cars on which it rested on the banks. The movements of the machine were all under the control of one leverman, observable in the illustra-

tion standing on the platform to the left of the bucket, from that position controlling levers to raise or lower the bucket chain, to move the car to the right or left, moving it forward on the side tracks and operating the engine. The car, bridge and machinery of the excavator weigh about 600,000 lbs. As the canal excavation progresses the rear track is taken up and relaid in front.

Some of the irrigation and canal work in California, more especially in the central and southern part of the State, is, like that above noticed, remarkable for its magnitude and the novel nature of the apparatus for construction, in many cases specially devised. Another canal built by the same company for the Stanislaus & San Joaquin Water Co. is sixty miles in length and carries water for the irrigation of 50,000 acres of land in Stanislaus and San Joaquin counties.

Besides thus creating artificial waterways, the San Francisco Bridge Co. also builds steel railways over the natural water courses of the State. On this page is also portrayed a steel bridge built for the N. P. C. R. R. Co., over the Russian river at Duncan's Mills, Sonoma Co. At the spot depicted there is in times of flood, a rise of 40 feet, and a current of ten miles per hour. This fact, coupled with the limited appropriation, required the utmost economy, and unusual strength in piers and superstructure, a combination which appears to have been dealt with successfully.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Excavating Irrigation Canal, Colusa Co., Cal.; Russian River Bridge, Sonoma Co., Cal., 577. General View of Dry Crushing Works of the Lupaards Vlei G. M. Co., Krugersdorp, South Africa, 580. Torpedo Boat Farragut; New Tire Remover; Side-Dumping Ore Car, 584.
EDITORIAL.—Excavation of Irrigation Canals, 577. Interminable Mining Suits: "Absolute Zero of Temperature," Ascribing the Purchase to Others: "About Face," Minority Rights in Mining Partnerships: Experts in the Treasury Department: Imports of Manufactures in '98: To Produce an Electric Arc Light Under Water: Importance of Appropriate Representation at the Paris Exposition, 578.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 585-6-7.
THE MARKETS.—The Local Markets: Mining Share Market: Sales in San Francisco Stock Board, 588.
MISCELLANEOUS.—Concentrates, 579. Dry Crushing at a South African Gold Mine—Lupaards Vlei Estate & G. M. Co., Ltd.: Lode Tin Mining in the Malay Peninsula, 580. Lugging in a Mine Shaft: The Kennen of Base Lead Bullion Containing Silver, and High in Gold, 581. Power Transmission Plants in Operation, 582. Industrial Notes: List of U. S. Patents for Pacific Coast Inventors: Notices of Recent Patents: Personal: Recently Declared Mining Dividends: Recent California Mining Incorporations: Commercial Paragraphs, 583. Current Mining Cases: The Torpedo Boat Farragut; Side-Dumping Ore Cars: New Tire Remover; To Revolutionize Lighting by Electricity: To Prevent Engines from "Racing," Stone Saw Set With Diamonds, 584.

SOME mining suits are as interminable as cases in chancery. At Washington, D. C., this week, argument was begun in the Supreme Court of the United States in the La Abra Silver Mining Company case, which has been before the court, in one form or another, since 1870, when an award of \$683,000 was made in favor of the company against the Government of Mexico and the money paid into the United States treasury. The payment never was paid, owing to charges of fraud in the proof supplied by the company in the prosecution of its case. The purpose of the present proceeding is to foreclose the claims of the company against the money paid in by Mexico. It is an appeal from the Court of Claims, in which tribunal the decision was against the mining company.

THE "absolute zero of temperature" lies 273° below the melting point of ice, Centigrade, or 460° Fahrenheit. This temperature has not been reached. It is unlikely that it will ever be reached, but an approach has recently been made to it by liquefying hydrogen gas and allowing it to boil at the atmospheric pressure. The temperature reached in this manner is about 243° Cent. It is thought that Professor Dewar, who has recently succeeded in liquefying hydrogen in quantity, will be able to produce a still lower temperature by causing the liquid hydrogen to boil in a vessel connected with an air pump, so that the pressure is reduced. For just as raising the pressure raises the boiling point of a liquid, as exemplified in the boiler of a steam engine, so lowering the pressure lowers the boiling point.

WHENEVER a considerable gold property is bought nowadays it is fashionable to ascribe the purchase to "the Rothschilds." So, whenever transpires the transfer of a copper property it appears customary to credit the Standard Oil Co. with desire or intent to "control all the copper mines in the United States." That were a big contract, too big even for the hundreds of millions of the great oil monopoly. Unlike oil production the copper product of this country is not susceptible of control by any aggregation of capital. When statements are put out by the daily press it is probable that behind or under the assertion is the manipulator of stock. For the past six weeks assertions have been made regarding control of the copper output that can only be credited to an effort to "boom" certain copper stocks. A few figures are in order. There are 100,000 shares in Calumet & Hecla. According to the daily press, Mr. Rockefeller "is offering \$800 per share for all of it." That is \$80,000,000. The Boston & Montana has 150,000 shares. For that \$500 per share is alleged to be offered, or \$75,000,000. The Anaconda Copper Co. is set down as being worth \$75,000,000 more in the schedule put out by the press reports: here, so far, is a reported inten-

tion to invest \$230,000,000 in securing a small segment of a great circle. To "corral" the copper producers would, in the same ratio, require an investment of \$1,000,000,000, a sum that is believed to exceed three times over all the combined resources of the Standard Oil Co.

"About --- Face."

Three years ago this paper, in an article discussing the industrial situation, said that whenever San Francisco quit thinking itself "the back door of the nation," but faced the other way, making itself "the front door," that the commercial horizon would be profitably broadened. J. J. Hill, the president of the Great Northern, at Seattle, Wash., this week, said:

"Look to the East and you find some 50,000,000 people who want but a small fraction of anything that you can produce here. On the other hand, look to the West, across the Pacific ocean, and you have 500,000,000 people who want everything you can produce and at your own price."

That is what this paper has been asserting. San Francisco builds great battleships and is splendidly advertised thereby the world round. The Oregon and Olympia have added new glories to the great flag that flies proudly with not a stripe torn nor a star missing. Doubtless, too, when the battleships Wisconsin and Ohio, now building here, are called upon, they will in that day of trial add new luster to local fame. The same skill that so grandly aids in the triumphs of war should be equally manifest in the achievements of peace. One sure way to get and hold commercial relations with the Pacific countries is an American merchant marine, and on this coast is the material. Everything is ready—the ability—the opportunity. Shall it be said that the inclination is wanting?

Minority Rights in Mining Partnerships.

A California subscriber asks: "In a case of several co-owners in a mining property, can the parties owning the lesser amount of the claim bring suit and force a sale of the whole property, and have the money divided?" This is a question of fact, the facts in the case not being stated. As an abstract proposition, if the party desiring partition or sale or both can prove in court the justice or equity of such wish, an order of sale is possible. As in all such queries a definite opinion of specific value can only be given by one in full possession of all the facts. On this general subject in the case of Dougherty vs. Creary, 30 Cal. 301, the Supreme Court of California says: "The conduct of the partners holding the major portion of the property in a mining concern is to be most jealously scrutinized when complaint is made, by the minority in interest, of oppression. It might, and often would, work great inconvenience and damage to the minority in interest in a mining partnership, if the majority were allowed to do as they might deem to their own advantage, regardless of the rights and interests of the minority; but, notwithstanding the danger of the abuse of power in such cases, what may be necessary and proper for carrying on the business of mining for the joint benefit of all concerned must be determined by those owning and holding in the aggregate the major part of the property; and if the powers which are thus attempted to be exercised are not necessary and proper for the success of the enterprise, those whose interests are imperiled or disastrously affected thereby have the right to resort to the courts for redress and protection."

It has often been seriously stated that at Washington, D. C., in the treasury department are two experts, one steadily engaged in the effort to produce an ink that cannot be successfully obliterated, the other in a more uniformly successful effort to "wash out" the ink so produced, and leave the inked surface in a condition that shows no trace of such treatment. Whether this be so or not, it is evident that between the safe maker and the safe breaker—the metallurgist and the burglar—there has been a somewhat similar contest for twenty-five years, the burglar being ahead in the scientific result of success in entering the finest constructed safes. Safe makers have long noted the use miners make of manganese steel, and have experimented

with such material in hopes of producing an absolutely burglar-proof safe made of manganese steel. Recent government tests at West Point, Willets Point and Newport have indicated the lines to be followed in such manufacture, with the result that manganese steel safes are now being produced that so far no burglar has been able to break or blow open. Each safe consists of but two pieces, the body and the door, and the joints are made so tight as to preclude the possibility of the introduction of any explosive. The triumphs of metallurgy are not confined to the successful or economical treatment of ores, and if, as appears certain, the metallurgist has finally vanquished the burglar in the long trial of skill, it is but one more feather in the cap of such progressive scientist.

IMPORTS of manufactures into the United States in the fiscal year 1898 were 30% less than those of 1888, although the population had increased 25% meantime. The Treasury Bureau of Statistics, which, as presented on page 560 of last week's issue, showed the growth in the exports of manufactures from 1868 to 1898, has prepared a similar table, showing the imports of manufactures in the same period. While this indicates that the imports of manufactures in 1898 were much larger than those of 1868 or 1878, it shows that in 1898 they were fully 30% below those of 1888. In 1888 the total import of manufactures was \$325,000,000, and in 1898 but \$226,000,000, while the total export of manufactures, which in 1888 was \$130,000,000, was in 1898 over \$291,000,000. The total export of manufactures in 1898 was not only the largest in our history, but for the first time was greater than the imports of manufactures, the total export of manufactures being \$291,208,358 and the total imports of manufactures \$229,991,231. A study of these Government figures, showing the growth of exports of manufactures and decrease of imports of this class of goods, reveals some interesting facts. Imports of iron and steel manufactures, which in 1868 were \$23,000,000 and in 1888 \$49,000,000, were in 1898 less than \$13,000,000, while exports of this class of manufactures increased from less than \$11,000,000 in 1868 to \$17,000,000 in 1888 and \$70,000,000 in 1898. The meaning of those figures is further emphasized when it is remembered that the population of the United States has increased from 36,756,000 in 1868 to 74,522,000 in 1898.

EXPERIMENTS with a view to producing an electric arc light that would give satisfactory practical results in use under water have not met with entire success, but Eastern technical journals report that a recent design of a submarine arc lamp of from 1000 to 2000 candle power by Messrs. Burdick & Hall, meets all requirements. The lamp is described as being absolutely water-tight, with an inner and outer globe, the upper part of the outer globe being hermetically sealed to the metal cylinder containing the feeding mechanism by means of rubber gaskets and rings. The feeding mechanism in this lamp differs from that of the ordinary arc lamp in that it is enclosed in a cylinder both water and air-tight. From the top of the cylinder, through a carefully-packed aperture, issue the two insulated wires, which, for convenience, are bound together into a cable. The lower portion of the lamp is protected by an eight-wire guard. Tests of the lamp at the depth of 25 feet are said to have been satisfactory.

NEARLY every mining commonwealth shows a realization of the importance of appropriate representation at the Paris Exposition of 1900. This week the executive committee of the California State Miners' Association decided to ask the State Legislature when it or if it appropriated money for California's representation to have one-third of such possible sum specially designed for the mineral exhibit. The result of such indeterminate action may not be satisfactory. It were better to settle on some specific amount—\$25,000 should be the minimum, twice that would be none too much—and take proper action to have a bill appropriating that amount for the specific purpose named passed by the State Legislature early in the coming session. That amount of money is necessary if any proper exhibit of the mining industry be made, and in the way indicated is the best manner of securing the necessary funds. The general advisability of such appropriation is too obvious to need argument.

Concentrates.

OWNERS of gold or silver quartz mills in Nova Scotia pay a Government royalty of 2%.

THIS year's dividends paid by the Silver King mine at Park City, Utah, amounted to \$450,000.

A STEEL CABLE 1½ inches in diameter, traveling twelve miles an hour, can transmit nearly 2000 H. P.

THE Calumet & Hecla Mining Co.'s dividend payable on the 29th inst. makes a total to that date of \$55,850,000.

FROM Grand Encampment district, Wyoming, copper ore is hauled sixty-five miles to the Union Pacific Railway at Fort Steele for shipment East.

STATE COAL MINE INSPECTOR GRIFFITH reports the amount of coal produced in Colorado this year to be 3,565,660 tons, an increase over last year of 300,000 tons.

IN his British official mine statistics C. Le Neve Foster reports there copper mining to be a decaying industry, and the lead and tin ore output also decreasing.

IN Georgetown, Australia, a miner is fined for returning to a mine after a blast within a prohibited time, or "for working a claim without a duly registered manager."

A MANCHESTER, England, smelting company is buying Kootenay, B. C., ore concentrates, for spot cash. These concentrates average 65% lead and 30 ozs. silver.

DURING the year 1897 the silver and lead production of the Consolidated Kansas City Smelting and Refining Co. was 11,757,540 ounces and 91,613,916 pounds, respectively.

CONSIDERABLE has been expended in Cariboo, B. C., hydraulic gold enterprises, there have been some substantial returns, and the several companies hope to begin declaring dividends in '99.

WHAT would at one time have been considered a singular combination is that of the Bonanza mine, Colorado, in which the ore richest in iron yields \$3.50 per ton in gold, and \$10 per ton in copper.

THE copper produced per ton of ore at the Rio Tinto mine is from 2 to 3½ per cent, at the Anaconda 4½ to 6 per cent, at the Quincy 1½ per cent, and at the Mountain Copper Co. 7½ per cent.

BRITISH COLUMBIA mining journals argue against the proposed Canadian legislation against alien ownership of mining property in the Dominion on the practical ground that "it will not pay."

FOR the first time since Aug. 8, 1888, Hale & Norcross stockholders this week got a dividend—\$1.50 per share—the result of successful litigation. The dividend amounts to \$168,000, a total of \$5,776,200.

ON Oct. 1 there were 5302 stamps in operation in the Rand, South Africa, district. In September these stamps crushed 695,103 tons ore. For the first nine months of '98 the Transvaal yielded \$57,588,610 in gold.

LESSEES who make good profit from working mines formerly mismanaged furnish practical illustration of the fact that lack of skill and experience of those in charge is a frequent cause of the "closing down" or up of a mine.

"THE first gold quartz mine operated in California" is said to have been the Havilah, now known as the Nashville, eight miles from Placerville, El Dorado Co., worked by Col. Chilton in 1849 with machinery brought across the isthmus.

A DUNEDIN firm, building at a cost of £3000 a gold dredger for an Otago, New Zealand, mining company, figures that by reason of its great capacity if 6 cents worth of gold can be got out of every ton of material that it handles great will be the resultant profits.

IN the Henriette shaft at Fleun, Belgium, at a depth of 3772 feet, ventilators supply 18,000 cubic feet air per minute. Temperature at the shaft bottom is 60° Fahr. when 32° Fahr. at the shaft surface. When first cut, in sinking, the rock temperature is 115° Fahr.

IN Colorado cyanide and chlorination make profitable lower grade ore than smelters treat, and, as elsewhere, the low-grade ore, being so much in excess of richer rock, contributes the largest proportion of the total annual gold yield. It is a case of quantity, not quality.

THIS paper solicits and welcomes the receipt of technical or practical articles on any subject of probable interest to its readers, and any expense attached thereto is at all times cheerfully audited. Sketches, photos, etc., for engraving often enhance the value of such articles.

COLORADO mining papers are beginning to advise owners of mines and prospects who want to sell to deal directly with the purchaser, to ignore the "middlemen," and advertise what they have to sell, the same as everybody else does. It would also aid in such a case to be able to show a clear title.

U. S. VOLUNTEER SOLDIERS in the late war are by law exempt from their share of required annual assessment work on unpatented mining claims. An affidavit setting forth the facts essential thereto must be filed with the recorder of the county in which the claim is situated before Jan. 1st, '99.

THE Tacoma Smelting and Refining Co. has by the purchase of its stock passed into the control of D. O. Mills, Henry Bratnaber, the Alaska-Treadwell Mining Co., the Grand Central Mining Co. of Mexico, the Bunker Hill & Sullivan Mining Co. of Idaho, and the Exploration Co. of London. The plant will be enlarged.

MILLS and smelters in Cripple Creek, Colorado, are reported to have formed a combination and made a uniform rate for ore treatment and raised the price to be paid for gold from \$19 to \$20 per ounce. The treatment charge is to be from \$7 per ton for ore containing one-half ounce of gold to \$14 for ore containing two ounces or more.

A COLORADO assayer writes: "I should like a little information from some of your scientific readers regarding zinc assays. Why do most of the authorities recommend zinc oxide in standardizing rather than metallic zinc? Does titrating a zinc solution warmed to 110° Fahr. (Von Schulz & Low's scheme) give too high results? Why not use oxide of copper in standardizing for copper assay?"

IT is estimated that all the gold mines of the world have this year increased their total production of the precious metal by 80 per cent, compared with the entire production of the world five years ago. The Director of the Mint estimates that this year's increase of production in South Africa, Australia and America will exceed that of 1897 by \$45,000,000.

IT is noted that in 1891 copper was 15 cents a pound, against 13 cents now. On about twenty large properties the paid-in capital is not much greater now than seven years ago, but the selling value of the shares of practically all the copper proper-

ties quoted in Boston is now \$172,401,700, as against \$50,237,000 in 1891, a gain of about 240%; all this with practically no enlargement in the number of dividend-paying properties.

MANY mine superintendents overburdened with expensive water will read with a feeling akin to envy of the superintendent of the Croesus Proprietary mine in West Australia, who, pending the arrival and erection of drainage appliances is daily selling 35,000 gallons of water from his main shaft at two cents per gallon, and who "has orders for 60,000 gallons daily" whenever he is able to supply it. This is better than the average gold mine.

THE dredger built in '93 by the Bucyrus Co. for Mississippi river use has a capacity of 300 cubic yards mud per hour, delivered through 300 feet pipe. Its propelling power is similar to the usual steam stern wheeler. The pump is a centrifugal, 15-inch suction and discharge, run by belt connection with a horizontal compound condensing engine. The dredger was built under direction of Jno. Mills, cost \$69,500, and works to a depth of 30 feet.

SEC. 2319 U. S. Revised Statutes provides that all valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States.

IT is a matter of present discussion among mining engineers as to the desirability of a change in the accepted methods of mine hoisting, but so far those who argue for a retention of the present system seem to have the best of it. The adverse argument is that hoisting engines run too much to speed, and that speed should be reduced and the power expended in hoisting more material with a slower system of endless winding. That idea may prevail in coal mining, etc., but its practical operation would run counter to the generally accepted plan of hoisting in nearly all metal mines.

GILSONITE is a hydrocarbon resembling in appearance bright friable bituminous coal. It has a brown streak, soils the fingers, is light in weight, burns readily, and is soluble in kerosene. It is brittle and about as hard as coal. Wyoming gilsonite differs materially from hydrocarbon found in Utah known as wurtzilite. Gilsonite occurs in well defined veins. An unusually large one is in the Ucomphage Indian reservation. As the mineral occurs in veins, its development possesses some of the features of coal mining and some of the risks of vein mining. The mineral is worth about \$40 per ton at Omaha.

SEC. 11 of the Territorial mining law of Arizona, in effect July 1st, '95, prescribes that the relocation of forfeited or abandoned lode mining claims shall only be made by sinking a new discovery shaft and fixing new boundaries in the same manner and to the same extent as is required in making a new location, or the relocater may sink the original discovery shaft 10 feet deeper than it was at the date of commencement of such relocation, and shall erect new or make the old monuments the same as originally required. In either case a new location monument shall be erected and the location certificate shall state if the whole or any part of the new location is located as abandoned property.

IN 1890 the United States produced 9,202,703 tons pig iron, worth \$151,200,410; in '97 this country produced 9,652,680 tons pig iron, worth \$95,122,299. In 1890 the United States produced 55,000,000 ounces silver, worth \$62,000,000; in '97 this country produced 54,000,000 ounces, worth \$32,000,000. In 1890 the United States produced 144,000 tons lead, worth \$13,000,000; in '97 this country produced 208,000 tons, worth \$15,000,000—a large falling off in current values for the three metals named. The other three metals—copper, gold and aluminum—show an increase in aggregate value of amount produced. But one metal—gold—remains the same—\$20.67 per ounce, whatever the date.

TIME was when the largest part of the circulation of this paper was in the State of California. Now, though its present circulation in that one State alone is twice what its entire circulation used to be, yet even that is but a small segment of the wide circle of its readers. During the last month this was particularly emphasized. During November there were received the names of 297 new subscribers from the region west of the Missouri river. Of these 59 were from Colorado, 48 from Montana, 45 from California, 28 from Arizona, 24 from Utah, 21 from Idaho, 12 from Washington, 18 from Oregon, 16 from British Columbia, 9 from Mexico, 4 from Chili, 6 from South Dakota, 3 from the Philippines, 2 from Tientsin, China, 2 from South Africa. There now is scarcely any region where metal mining is carried on that is not reached by this paper.

AT San Francisco on the 7th there was filed in the U. S. Circuit Court a mining suit involving property in Tuolumne and Mariposa counties, Cal. The Merced G. M. Co., a Montana corporation, is the complainant. The accredited respondents are Dorward, Babney & Corcoran of Coulterville, Cal., who appear as representatives. The Merced Co. owns thirty mining claims near Coulterville, Cal. When the claims were purchased the company also bought a ditch forty-five miles long, with water rights and the right to the water of the south fork of the Tuolumne river. For a time the company used steam power to work its claims, and the respondents allege that they considered that the ditch and its water rights had been abandoned and filed new locations, hence the present litigation.

IN the Philippines more work is done in the copper mines than in any of the other mineral fields. The natives have long had the art of working in copper, and about fifty years ago a company of Europeans was organized to work the copper mines, but the Spanish laws were so oppressive upon production that they have done very little development. The natives smelt the copper in a crude way and make copper utensils for their own use and for sale to the Christian settlements, but among the Spaniards there has been nothing done in the way of manufacturing copper. The copper ore is rich, though refractory, containing 16 per cent copper, 24 per cent sulphur, 5 per cent antimony and 5 per cent arsenic. For a short time about half a century ago some rich copper mines were worked by Assit, in the island of Masbate, but they were obliged to quit on account of excessive taxation.

THE "specific heat" of any substance is the ratio of the quantity of heat required to raise the temperature of any given weight 1°, under specified conditions, to the amount

demanded to raise the temperature of an equal weight of water 1° when at the lower of the two fixed standards of temperature—usually taken as that of melting ice, or the "freezing point." The specific heat of any substance thus determines what rise or fall of temperature will follow the introduction, or the abstraction, of any given amount of heat. Recent exact experiments in the specific heats of copper, iron and aluminum give the following figures:

| | Between 181° and 150° C. | Between 73° and 100° C. |
|---------------|-----------------------------|----------------------------|
| Copper..... | 0.0888 | 0.1040 |
| Iron..... | 0.0914 | 0.1162 |
| Aluminum..... | 0.1833 | 0.2175 |

Liquid oxygen was employed to obtain the lowest of the temperatures. The right hand column gives the specific heat at ordinary temperatures.

A "POCKET" in quartz is gold concentrated in a quartz ledge. It may occupy a few inches or a few feet lengthwise of the ledge and the chute may run down lengthwise many feet. Beyond a few inches or a few feet lengthwise of the ledge the rest of the ledge may not contain a color of gold, or it may pocket in other places, which it often does. Pockets are generally found near the top of the bedrock. But many have been found 50 or 100 feet and even deeper. A pocket may contain a few dollars or many thousands, generally governed by the size of the ledge and the amount of iron in and around the ledge, caused by an iron stringer striking the ledge, where the pocket is found. Without the presence of iron, there cannot be a pocket. But iron in a quartz ledge is no evidence of a pocket or of gold. Pockets may occur in any formation—slate, granite, serpentine, porphyry, or any other—but probably no one ever saw one, or heard of one, where the upper or hanging and lower or foot wall of the ledge were of the same formation. There must be contact to make a pocket.

UNDER the rulings of the land department of the United States contests may be initiated by an adverse party, or other person, against a party to any entry, filing or other claim under laws of Congress relating to the public lands for any sufficient cause affecting the legality or validity of the claim. There is no limit to the number of entries that any one person may contest or protest. Under the rules of July 9th, '94, protests or contests as to the mineral character of any of the lands embraced in a railroad list of selections suffice to cause a hearing to be ordered in the local land office, after giving due notice to the railroad company and the person furnishing such information. There is no particular form necessary in the wording of the protest, but it should properly contain as full a statement of the facts, showing the land to be more valuable for minerals than for agriculture, as the protestant can make. The fact, for instance, that it is covered in whole or in part by a mining location, and that it is being worked for its minerals, is important. The better practice is to make verified protest, and corroborative evidence, while not absolutely necessary, adds, of course, to its weight.

AS THE constant of a riveted, uncoated metallic flume is 141.42, and of an ordinary wooden flume 76.7, and 141.42 ÷ 76.7 = 1.844, velocity or discharge for such wooden flume multiplied by 1.844 gives the velocity or discharge of a metallic flume, uncoated, if the flumes are of equal dimensions and grades. The positive coefficient of asphaltum coated flumes is 158.10, and 158.10 ÷ 76.7 = 2.061. Hence, the velocity or the discharge of a coated flume of equal dimensions and grade with a given wooden flume would be 2.061 times greater than that of the wooden flume. As between a coated and an uncoated metallic flume, the coated flume will generate a velocity of 1.118 times the uncoated flume, both being equal in size, shape and grade. The metallic flume will not require as steep a grade nor as great an area, therefore, for the same carrying capacity as a wooden flume. Its great durability, in connection with this fact, suggests that it would, in Arizona, be the more economical of the two. Where lumber is of poor quality and high in price, and steel or iron is cheap, small sheet iron or steel flumes may be economically made semi-circular in cross-section, and thus enclose the greatest area with the smallest possible quantity of metal or metal perimeter.

THE measurement of the velocity of a projectile in its flight from a gun is the division of a certain space passed over by the time which it has taken to do this, space and time being determined by measurement and simple apparatus. Somewhere in the path of the projectile are placed two wire screens, each formed of a simple frame, across which a wire runs back and forth, forming part of an electric battery circuit, in which an accurate timepiece is also interposed. As the projectile, on being fired from the gun, passes through the first screen the circuit of which it is a part is broken and the clockwork is started, the index originally pointing to zero. On passing through the second screen the projectile interrupts the second circuit, with the effect of instantly bringing the clock mechanism to a stop. Knowing, then, the exact distance between the two screens, usually several hundred feet, it follows that by dividing it by the number of seconds or the fractions of a second marked on the clock dial, representing the time which has elapsed during the passage of the projectile from screen to screen, is obtained the number of feet per second which the projectile was traveling. The satisfactory measurement is in the accuracy of the time determination, in which the smallest fraction of a second becomes a factor of importance.

NO ONE can more than give a guess as to the amount of gold and silver at any one time in the world or how much of such metal is held and used by the people of the world as money. Gold and silver which were being used as ornaments or as money in the days of Abraham may yet be in existence, and in some form may now be serving the same purposes as they did nearly 4000 years ago. The ornaments of that day may now be doing service in the sovereigns of Great Britain or the eagles of the United States, and the coins of that day may be doing service at the present time in watch chains, breast pins, sword hilts, in the coronets of kings or in filling the teeth of several million human beings who are compelled to rely upon the work of dentists for the mastication of their food. Pure gold and pure silver are the same the world over, and the output of any one year can be mingled with the output of any other year or years, and the combinations thus made produce no changes in either metal. Pure gold and pure silver remain precisely the same through all ages, and hence neither by look, weight or other mark can the product of any given year be distinguished from the products of 6000 other years during which the human race have been producing these metals. So it is useless for any one to claim accuracy as to the exact amount of either metal now in existence, or as to in just what form or shape such metal may be found to-day.

Dry Crushing at a South African Gold Mine ---(Luipaards Vlei Estate & G. M. Co., Ltd.)

Written for the MINING AND SCIENTIFIC PRESS by GEO. H. FURNER,
General Manager.

The Luipaards Vlei Estate & G. M. Co., Ltd., is freehold owner of the whole farm Luipaards Vlei adjoining Krugersdorp and possesses two home-stead reserves on which are growing 143,000 trees. A revenue of £8000 a year is derived from the estate. There are seven water rights and two dams. The mining area of the company consists of 463 mineral claims and some eighty-six outside claims. Three gold-bearing banket reefs run through the property, but only one, the Bothas, is now being mined. The mineral which is now being treated is entirely pyritic.

The sorting is done at each headgear—the coarse being separated for purposes of sorting, and the fines for the purpose of (in time) evaporating as much of their moisture as possible. The ore is delivered from the trucks to the first of the rock crushers, the product of this crusher is then put through the second rock crusher. Revolving trommels are set here to separate the crushed ore into three grades, one for each of the rollers. Below the stone breakers is a large bin for intermediate storage of the sized ore; this bin discharges into trucks, which are run to an electric elevator. This appliance is certainly one of the first electric lifts at work

no dust, the elaborate appliances which are in place for dust prevention are at present lying idle.

For driving this plant the high pressure half of a tandem compound engine, 300 H. P., is in use. This engine drives the mill and crusher house counter shafting, also two 100 H. P. dynamos for generating the power required for working the electric pumps, hoisting engines and motors for cyanide works, fitters' and blacksmiths' shops. A separate engine runs the electric light plant and a 100 H. P. auxiliary engine serves as a standby.

A compressor is at work of 10-drill capacity. Four 100 H. P. boilers and heat economizer supply steam to the plant.

The ore from the finished product bin is conveyed into the first treatment tanks by an endless belt. Here it receives a short treatment of from two and one-half to three days, the amount of solution allowed being one-half the weight of the ore. During this treatment 70 per cent of the gold contents of the ore are extracted.

The ore is then transferred by mechanical haulage to the second tier of tanks. In these it is allowed to remain for about four days without further washing; the object being to allow of the air permeating the entire mass of the ore while in contact with the cyanide, thus ensuring a sufficient supply of oxygen necessary for the solution of the gold by the potassium cyanide.

The treatment is completed by a succession of weak washes, amounting to one-half of the weight of the ore, and a final water wash equivalent to the amount of moisture carried away in the residues (12½ per cent of the weight of the dry ore). The reason

treated; this with a gold extraction of 82 per cent. The present consumption is under one-third of a pound per ton.

The reason of this abnormally low consumption is that the cyanide solutions going on to the dry ore are only slightly reduced in strength, and there is never any reason for running to waste large quantities of solution too weak to be worth conserving, as in the case of mill tailings where strong cyanide solutions going on as first washes become diluted by the mass of moisture in the ore.

Again, the cyanide wash pumped onto the dry (and therefore air-containing) ore has access to the gold at once with a plentiful supply of oxygen available. The action is therefore much more rapid than in the case of wet tailings where the cyanide has gradually to displace the moisture in the ore particles by the slow process of diffusion, becoming diluted in the meantime. The action is further retarded in the case of wet tailings by the absence of sufficient oxygen, unless artificially supplied.

One of the strongest points in favor of dry crushing is the immense saving in water.

It not being necessary to run to waste any portion of the washes draining down from the tanks, the only source of loss is the moisture carried away with the residues. This only amounts to twenty-one tons moisture for each charge of 170 tons ore, or twenty-five gallons per ton of ore treated.

Compare this with 300 gallons of water per ton of ore treated (figures given as pertaining to the most recent practice of economy in the water used in the reduction and treatment of ore by wet crushing).

Even with the small tonnage treated here per month the cyanide working costs will compare favorably with the wet crushing plant treating a much larger tonnage of sand and slimes. The average cost per ton for the last three months, treating 3400 tons monthly, has been three shillings and four pence per ton.

Lode Tin Mining in the Malay Peninsula.*

By W. H. DERRICK.

The Pahang Corporation holds in Kuantan, Pahang, one of the Federated Malay States, a concession of 100 square miles. Tin, both lode and alluvial, have been found over the greater part of the concession, but the payable lodes lie in an area of ten square miles. These lodes run approximately east and west, and are from 50 to 2000 feet apart, range in thickness from 2 to 10 feet, and produce from 1 to 15 per cent of tin oxide to the ton. The lodes underlie both north and south, at angles ranging from 10° to 40° from the vertical; they have generally one well defined wall, but seldom two. The granite country rock is overlaid by varieties of clay schist, with the tin lodes running down right through the slate into the granite. A few isolated hills of calcspar remain, although at one time this rock must have covered the slate, as the latter is everywhere seen intersected with veins of spar.

The principal metals found in the lodes are tin, copper, iron, and arsenical pyrites, blende, and galena. Of these metals, tin and copper only have been discovered in workable quantities; the latter usually carries from 25 to 30 ounces of silver to the ton, and appears to be quickly giving place in depth to tin.

The mines now being worked by the Pahang Corporation were, so report says, continuously worked by Malays and Chinese for more than 100 years, the large surface excavations made by them, some of which are 1000 feet long, 200 feet wide and 150 feet deep, testifying to this being a fact. The open-cast system was the only one adopted by the old miners, and as timber was seldom made use of to secure loose ground, the sides of the workings were sloped or terraced to keep them from falling in. This, and not the thickness of the lodes, accounts in many instances for the great width of the old workings. Under native management (at least within recent years) the mines were not a financial success, owing apparently to want of capital, and, consequently, of proper machinery, as well as the native objection to do anything in the shape of dead work, their mode of operation being to follow any payable ground from the surface down as far as they were able to without steam pumps and timber.

Explosives of any description were never made use of, owing to a strange superstition firmly believed in by the Chinese, viz.: that the use of explosives frighten away the metal in a mine. In consequence of this, any very hard ground could not be worked. The ore obtained was crushed by wooden stamps shod with iron and worked by small overshot and undershot water wheels. The only dressing appliance used was a long-tom, the tail losses from which were very heavy. These tails were assayed and found to contain as much as 7 per cent of tin oxide. They are principally composed of coarse grains of tin and quartz adhering together, and which only required finer crushing to allow the tin to be readily separated out.

For working the mines the Pahang Corporation make use of Chinese, Javanese, Malay and Tamil

*Condensed.

GENERAL VIEW OF DRY CRUSHING WORKS OF THE LUIPAARDS VLEI G. M. CO.,
KRUGERSDORP, SOUTH AFRICA.

in South Africa; its performance is singularly cheap and satisfactory, and merits the respectful attention of our mechanical engineers.

The ore, now roughly about 1½ inches fine, is then served into a crusher; this has a corrugated face, and the smaller roll is faced with manganese steel. The crusher delivers its product in an ingeniously automatic manner to a revolving screen. The ore is then delivered onto a traveling rubber belt about 18 inches wide, moving at a rate of 300 feet per minute, and having a capacity of forty tons per hour. This serves the ore into the well of a bucket elevator, having an 11-inch belt also traveling 300 feet per minute; the buckets being every foot apart. The ore is thus delivered to the top story of the mill house, into a pair of revolving trommel screens. Here it is divided into three grades; the coarsest going back into the first set of rolls, the second grade to the finer rolls, and the finished product into its own bin. At present the first set of rolls breaks the ore to a fineness of about ½ inch. The product is delivered by the same belt to the revolving trommels. An exactly similar procedure is followed with the second set of rolls; the same traveling belt and the same screen serving for them.

Before the crushed ore is passed through the first roller it is subjected to the action of a magnetic separator; a look at the stuff, thus removed from being fed into the roller, shows how necessary a precaution the separator is to allow the mill doing fair work. The size of the finished product as it issues from the revolving trommel after leaving the finer rolls is 200 mesh per square inch. The product is then conveyed by a separate rubber traveling belt to the vats, the distributor belonging to the belt allowing of an extremely even and convenient distribution of the sand into every part of each vat. As the ore now mined is sufficiently moist to make

of the final water wash is to expel the residual cyanide solution which would otherwise be carried away to the dump and unnecessarily increase the cyanide consumption, and also to balance the loss in the sumps from the moisture discharged with the residues.

This second treatment secures an additional extraction of from 10 to 15 per cent, or a total extraction of from 80 to 85 per cent.

The following are the treatment results obtained during the past seven months (March to September) from oxidized and pyritic ore crushed through the various sizes of screens as undernoted:

| RESULTS OF TREATMENT. | | | | |
|-----------------------|-----------------|-------------------------|-----------------------|-----------|
| Nature of ore. | Size of mesh. | Ore value per ton. Dwt. | Residue per ton. Dwt. | Per cent. |
| Oxidized..... | 1-10 inch | 9.9 | 1.1 | 88.9 |
| Oxidized..... | 1-8 inch | 8.1 | 1.1 | 85.6 |
| Oxidized..... | 1-8 inch | 7.8 | 1.2 | 84.0 |
| Pyritic..... | 100 per sq. in. | 9.25 | 1.77 | 80.0 |
| Pyritic..... | 200 per sq. in. | 1.1 | 1.2 | 85.0 |

Points in Favor of Dry Crushing.—The points in favor of cyaniding dry crushed ore are simplicity and cheapness of treatment combined with a high extraction, in proof of which some of the special features may be summarized.

The whole of the mill product is sent into the tanks and treated at one operation with highly satisfactory results, thus doing away with the classification into sands and slimes (unavoidable in the case of wet crushing) with the separate and costly treatment necessary for the latter product.

The main item of expense in the working of a cyanide plant, viz., the consumption of the cyanide of potassium itself, is much less in the treatment of dry ore than in the case of wet tailings.

The amount of cyanide consumed during the treatment of 22,533 tons at Luipaards Vlei Estate has been 8900 pounds, or only 0.39 pound per ton of ore

labor, Europeans being employed for supervision work only. With the exception of ore dressed, all work is let out on contract. Stopping is paid for by the truck of 16 to 18 cwt., prices delivered at the battery ranging from 1s 9d to 6s per ton, according to the nature of the ground stoped, and the distance of the mine from the battery, which in some cases is as much as two miles, the mines being all connected with the batteries by tramroads.

Contractors pay for all tools and materials, dynamite, fuse, detonators, candles, etc., and put in timber as required. If the quality of the ore delivered at the battery drops below a certain percentage (which is fixed at the time of letting the contract), the contractor receives nothing for such ore. This ensures the company against the delivery of waste. Each contractor's parcel of ore is stamped separately, and is constantly sampled and assayed as it passes through the mill. Driving and sinking are let by the fathom, and prices range from £1 10s to £4 for drives, 7x5 feet; £2 10s to £5 10s for winzes, 6x5 feet; £5 to £30 for shafts, 12x4 feet—these dimensions being all clear of timber. Contractors, as in stoping, pay for all stores and put in timber as required, the timber, of course, being supplied free by the company. Drills are sharpened for contractors free. At one time this work was charged for, but it was found men wasted much time by using blunt tools rather than pay to have them resharpened.

The distances driven per month, by a gang of six men working in eight-hour shifts, vary from 10 to 40 feet according to the nature of the ground. Shaft sinking ranges from 10 to 20 feet per month in hard slate when twelve men are employed working six-hour shifts. The Chinese miner makes good progress in moderate and soft ground, but is usually a poor miner in really hard rock, and on this account he can not compete with white labor. If time alone was the sole consideration in mining, this might be so, but when expense also is taken into consideration, it is far otherwise, a fact which is very apparent when one considers that white labor, when employed on actual mining work, is about ten times as expensive as native labor; in other words, a white man has to drive or sink ten times the distance done by a native in order to compete with him, whereas in any but hard ground his progress would probably not much exceed that of an ordinary skilled Chinese miner.

The average cost of mining, including cost of drives and winzes (but not permanent shafts), timber, hauling and pumping charges and European supervision, is 5s per ton. The Pabang Corporation have two batteries of 40 and 20 head of stamps respectively. The stamps are of the usual Californian type, weight 850 pounds, and, driven at a speed of ninety blows a minute, they crush about 2½ tons per head per day. Vertical, high-pressure, non-condensing engines supply the motive power. At present some 2500 tons of tin stone are being treated per month for a yield of eighty-five to ninety-five tons of tin oxide—an average of about 3½ per cent per ton. The ore is only crushed fine enough to pass through screens having eighty to 120 round burr holes to the square inch.

The dressing appliances first introduced were concave and convex buddles from 12 to 25 feet in diameter, frames and tossing gear; but, notwithstanding the cheap labor available for working these, they are replaced by modern machinery with the best results. For calcining, the ordinary reverberatory furnace is used, and, with wood at 10s per cord, cost of roasting, including labor, is 4s per ton of concentrates treated.

The dressing coolies cost 18s per month. Native engine-drivers, carpenters and blacksmiths, £2 to £3 per month. Europeans, for supervision work, £20 to £30 per month. The total dressing cost, which includes stamping, European supervision, native labor, stores and roasting charges, is 5s 6d per ton of stone crushed. The standard to which the oxide is dressed always exceeds 70 per cent of metal, the impurities being oxide of iron, a little silica, and from 1/16 to 1/8 per cent of copper. The total battery losses range from five to eight pounds to the ton.

Lagging in a Mine Shaft.

To THE EDITOR:—In your issue of the 12th ult. is an article upon the use of structural steel for sustaining a mine shaft, which is to be lagged with 4 inch plank. My observation and experience convinces me that many shafts are lagged too heavily. If a shaft is sunk through compact, hard, unchanging rock, no lagging is required. If through hard, blocky rock, lagging of sufficient strength as to restrain such blocks, with a 6-foot rise of sets 1½ to 2 inches, should meet the requirements; if of massive, seamy ground, or of heavy, clayey, swelling ground, 1 to 1½-inch, and if of simply disintegrating ground, 1 inch should be sufficient.

The duty of shaft frames for deep work should be to carry, with stability, such erections as become necessary for the underground work, as guides, pumps, pipes, etc. If a shaft is cared for as hereafter suggested, no extraordinary strength of shaft pressure is required, and under some conditions no strength without such care is adequate.

The purpose of lagging in a shaft should be to

safely restrain everything between sets, but when an unusual stress is thrown upon the lagging it should not be so thick and strong but it will readily show it by bulging, and when, in the judgment of the superintendent or foreman, depending upon the form of organization, the pressure is becoming so great as to convey too much stress to the sets, sufficient of the lagging should be removed as to enable the taking out of the pressing material and the lagging replaced. In all shafts subject or liable to pressure the lagging should be cut the length of the sets and no longer, unless it becomes necessary to drive. In no instance should stress be allowed to accumulate upon the lagging to such an amount as to show bending or crushing stress upon the shaft frame, and as the exigencies of work induces to a neglect of the shaft as long as possible, light lagging is preferable, as, while fulfilling its requirements, it gives early notice of danger to the sets.

I have seen a mining shaft where, through a heavy body of clay, the pressure throughout could not have been less than 1000 pounds per square foot, and where solid 12-inch timbering was continuously pushed in—very gradually, of course—by the swelling of the clay, like so much cardboard, which was changed to 12 inch sets and 2 inch lagging, and gave but comparative after trouble; occasionally the lagging had to be relieved. Its thickness of 2 inches showed be too much; 1½-inch would have been better.

CALIFORNIA MINER.

The Refining of Base Lead Bullion Containing Silver, and High in Gold.*

NUMBER VI.

By G. H. BLAKEMORE.

Effect of Copper in Retorting Process.—In the description of the desilverization process it will be remembered that after the kettle has been charged from the "softener" the lead is allowed to cool back until it "rings" around the edge some 3 inches. This cooling causes a considerable amount of copper dross to be given up by the lead in addition to that extracted in the softening process. If this copper is left in the lead, it has a rather serious effect in the retorting process. The dross formed in the retort from alloy containing much copper will often contain more gold than the bullion itself. As the proportion of dross on the 475 charges was about one-seventh of the weight of the bullion, it can easily be calculated out what gold was tied up by being thus thrown into the dross. The following assays will make my remarks clearer:

| Bullion Assay Per Ton. | | Dross from Same Per Ton. | |
|------------------------|----------|--------------------------|----------|
| Ag. Ozs. | Au. Ozs. | Ag. Ozs. | Au. Ozs. |
| 1614.9 | 78.7 | 1799.95 | 392.15 |
| 1212.9 | 37.1 | 2410.05 | 335.15 |
| 1355.6 | 17.0 | 1552.00 | 223.25 |
| 978.1 | 10.2 | 1644.89 | 311.10 |
| 272.6 | 31.2 | 2179.25 | 344.55 |
| 1246.4 | 11.1 | 2257.35 | 304.10 |
| 1108.2 | 10.2 | 2620.10 | 390.20 |
| 1716.9 | 66.3 | 1727.15 | 313.30 |
| 1558.1 | 29.1 | 1755.10 | 245.25 |
| 1340.0 | 52.6 | 2041.60 | 210.20 |
| 934.0 | 4.5 | 1334.20 | 210.90 |
| 1113.6 | 7.5 | 1422.05 | 278.65 |
| 821.2 | 0.8 | 1544.65 | 198.60 |
| 1250.8 | 1.9 | 2254.55 | 355.65 |
| 1014.9 | 4.7 | 961.05 | 133.75 |
| 111.0 | trace. | 1655.5 | 91.55 |

The last six of these instances are the most remarkable, the end one of all actually having only a trace of gold left in the bullion, all the gold having gone into the dross, and nearly all the silver. These assays were made from carefully taken samples and there is no doubt as to their correctness.

When the precaution has been taken of allowing the softened bullion in the desilverizing kettle to cool and so eject more copper, it is noticeable that more zinc is produced from each retort working on alloy made from the more copper-free bullion, and what is more important still, the amount of gold and silver recovered in the retort bullion is considerably increased, the value of the retort dross being correspondingly reduced. Where only 50 per cent of the gold that goes into the refinery in the base bullion may be recovered in dore bullion through copper being allowed to remain in before zincing, the recovery reaches 85 to 90 per cent after the copper is taken out, the differences in both cases going back to the blast furnaces tied up in by-products induced by the presence of copper in the bullion. Copper is a most difficult metal to get rid of, and in spite of all efforts, will be finally found in the dore bullion. I think that the cause of the retort dross being high in gold and silver is due to the presence of a copper-zinc-gold-silver alloy being formed that the lead has very little or no action on. The copper is, of course, the inducing agent of the alloy. My reason for thinking this is that on several occasions when the drosses have been extremely high in gold and silver a thin, white, hard and brittle skin of what appeared to be matte was to be seen on the face of the retort bullion after it had been poured and cooled. Occasionally it would be 1 inch thick. The alloy was very

*Australasian Institute Mining Engineers.

heavy and it broke with a conchoidal fracture. An analysis of it gave as follows:

| | Per Cent. |
|--------------|-----------|
| Copper | 39.00 |
| Zinc | 55.80 |
| Lead | 3.00 |
| Gold | 2.630 |
| Silver | 9.847 |
| Total | 100.286 |

I only observed this alloy once, so cannot say if the analysis is representative of its usual composition, but having never noticed any previous mention of such a combination, it may be of interest.

The retort dross is either "sweated down" on a concentrating cupel with lead and litharge or else put into the softening furnace after the copper and tin skimmings have been taken off. If the latter, it is kept in for about three hours and well stirred up with the lead. This method extracts a good deal of the gold and silver, but it cannot be considered satisfactory.

Refining for Dore.—This is done in English cupel furnaces, the retort bullion being first concentrated in water-jacketed cupels up to a grade of 50 or 60 per cent of combined silver and gold contents. The cupel furnaces are like the rest of things in connection with the refinery, built to suit the work to be done. The concentration cupels are better if they are larger in size than the refining cupel, and the capacity of the latter should be not less than 1000 pounds for the size of plant that has been discussed. If the concentration cupel has been made large enough to hold about 1500 pounds it presents a nice large bath of lead on which to sweat down "retort dross" or slag from melting down silver or any small quantities of incidental rich by-products that are produced in a refinery.

The concentrating cupel should be water-jacketed; some refineries simply use an inch pipe with water circulating through it and embedded in the composition of the cupel at the level of the litharge in the cupel when in work. At other places the Steitz water-jacketed cupel is used. The jacket in the latter is separate from the cast-iron bottom, on which it simply rests. The part of the jacket facing the litharge is sometimes made of copper in preference to boiler iron, the claim for the copper plate being that it is not attacked by the molten litharge when the latter has cut away all composition back to the jacket. A concentrating cupel will last several weeks; but in time the bottom begins to "throw up," "shelve" or "float up" (the terms are synonymous) and then it may go in a few hours or still last for days. The principal points which produce a lasting concentrating cupel is to have it well water-jacketed and to have it thoroughly dry before using it. The component parts of the composition or filling of the "cupels" or "tests" vary in different refineries.

The following are some I have personally tried and no particular advantage can be claimed for any of them:

| | Parts. |
|--|--------|
| No. 1.—Ground marble (limestone) | 7 |
| Cement | 2 |
| Fireclay | 1 |
| No. 2.—Carbonate of magnesia (magnesite) | 4 |
| Limestone | 4 |
| Cement | 1 |
| Fireclay | 1 |
| No. 3.—Limestone | 8 |
| Cement | 1 |
| Fireclay | 1 |

Sometimes a cement composition is used in the concentrating cupel and this usually lasts very well, but it depends considerably on the quality of the cement used. When a cement test commences to "float up" it is done in a few hours as a rule.

As before stated the retort bullion is first concentrated up until the contents of the cupel assay about 50 to 60 per cent of silver and gold combined, i. e., supposing dore bullion is being made of the same content of silver if silver is being produced. When this assay is reached, five or six bars of the rich bullion—about 450 pounds—are ladled out, and more retort bullion worked up until the test is full once more, when more of the concentrated bullion is withdrawn. When enough "concentrates" have been made to produce about 1000 pounds of dore, the refining cupel is started and the concentrates "run up." In concentrating, a man can usually work up from twenty to thirty bars, or from 1800 to 2700 pounds of retort bullion in each shift, if everything goes smoothly. The amount of concentrates produced of course depends entirely on the assay value of the retort bullion. I omitted to state that the concentrating test has a water-jacketed litharge gutter to prevent the litharge cutting the front of the cupel down, but in the refining cupel there may or may not be, according to taste, a water breast. With a water-jacketed breast the work of concentrating and refining may be entrusted to a much less skillful man, which I need not point out, is a decided advantage. The gutter in the concentrating breast is best about 1½ inches wide and about ½ of an inch deep.

As the charge in the refining cupel begins to approach fineness the heat must be raised considerably to prevent it "setting." When the charge is fine it presents a really beautiful sight. It is exactly like a flawless mirror; every tiny detail of the firebrick roof is clearly delineated in its depths. A sample is assayed (by the wet method for promptness) before

the charge is ladled out, to determine its fineness. This is not so necessary if the charge is dore. If the latter, it is ladled out into moulds about 12x10 inches by $\frac{1}{2}$ inch deep; if silver it is ladled out into 1000-ounce moulds, which have a loose plate placed in the middle of the mould for the purpose of dividing the bar into two pieces, sizes which are convenient in the after remelting and casting into market bars. If silver is being ladled out, one man uses the ladle and another man stands by with a rod flattened at one end. As the bar is filled, the man with the rod pats the top of the silver and so stops the spurring which would otherwise take place through the oxygen which has been absorbed by the silver being squeezed out on the solidification of the latter. Dore bullion does not vegetate like the pure silver, and no precautions are necessary when baling it into the flat moulds.

(To be Continued.)

Power Transmission Plants in Operation.*

By CHAS. F. SCOTT.

Beginning with the plant at San Bernardino and Pomona, Cal., which began operation in '92, using 10,000 volts and transmitting thirty miles, a constantly increasing number of plants have been installed operating at 10,000 or 15,000 volts. In some cases there has been little or no trouble experienced with the transmission lines, while in other cases the experiences have been less satisfactory. The principal trouble seems to have been a poor grade or an insufficient size of porcelain insulator. In other cases the insulators, sometimes porcelain and sometimes glass, have given almost perfect satisfaction.

The superintendent of a power company which has been running fifteen months with about 15,000 volts reports that they "have had absolutely no trouble whatever of an electrical nature." Some insulators were broken because they had been used as targets by small boys or hunters, but only the outer petticoats were broken, and no short circuits occurred, although in some cases insulators were in use for months with most of the outer petticoats chipped off. The distance of transmission is twelve miles. Porcelain insulators are used.

In another plant which has been in operation about a year and a half, employing 15,000 volts for a distance of nearly thirty miles, there have been but three shut-downs on account of line difficulties. These were due to the breaking of insulators at a point where the line was spiraled. In one case the repair was made in half an hour, and in the other case a few minutes interruption to the service was sufficient for repairs.

The line is regularly patrolled, and if a defective insulator or pin is found, the generating station is notified by telephone and the line is shut down for a few moments at noon. In one case two poles were burned by a defect in the insulators on the top of each. The poles burned to the ground, leaving the line hanging clear without any one at either the generating station or sub-station being aware of the fact.

Troubles have arisen on some lines by the burning off of pins by the passage of sparks from the outer edge of the insulator to the pin. These sparks make small holes in the pin no larger than a needle point; but after continuous sparking for some time the pin becomes entirely charred. An iron pin suggested itself as a remedy, but additional strains and liability to break-down are liable when a conductor is placed within the insulator. The burning off of pins has occurred where small porcelain insulators are porous and the outside glaze is imperfect, while the glaze on the inside is good. When the porcelain is filled with water the current readily passes through it to the lower rim of the insulator and then sparks across to the pin. In one place which has been running for about three years some 250 pins burned off. The early insulators have been replaced by larger and better ones, and this defect has disappeared.

A 10,000-volt line which runs for a dozen miles or more within a few hundred yards of the Pacific coast has burned cross-arms on nearly every pole. The cross-arms near the ends of the line, which are away from the coast, are not burned. Usually the burning appears as a mere blackening of the cross-arm for a short space between the insulators, on one side of the arm. In some cases the charring is deeper and appears on both sides. The side on which almost all of the burning occurs is the one toward which the winds come from the ocean, bearing the mist of salt water. The wire shows discoloration, and the iron braces for holding the cross-arms are in a few cases eaten through. Moreover, the cross-arms were green and full of sap when erected. The early porcelain insulators were porous, and have now been replaced, and the pins are of iron. The charring has ceased almost entirely since the new porcelains were put up.

It may be observed that in the plants which are herein referred to, and in the experimental tests, no mention has been made of insulators with cups con-

taining oil for reducing the surface leakage. Insulators of this kind were used in the Frankfort-Lauffen experimental transmission line at 30,000 volts. Practically, however, the surface insulation is adequate without oil cups, and the principal duty of the insulator is to prevent the current passing over the surface and jumping to the pin or cross-arm—a matter with which the oil would have nothing to do.

Telephone lines are in use in a number of plants placed on the poles which carry the transmission wires. The telephone lines are usually placed some distance below the transmission wires and are crossed at frequent intervals. The telephones in general work very satisfactorily.

There appears to be practically nothing in power transmission in Europe using high potentials outside of Switzerland. The installation in Paderno in Switzerland is operating at 15,000 volts, the highest voltage which has been used in that country. The damp weather is one of the limiting factors. The insulators used are porcelain with a triple petticoat.

Forty Thousand Volts in Commercial Service.—The highest voltage which is used for transmission is in the Provo plant of the Telluride Power Transmission Company in Utah, which transmits power thirty-five miles to the Mercur mills at 40,000 volts. Raising transformers are three in number and are connected in the star form. Each transformer has a capacity of 250 K. W. The middle points of both the high-tension and low-tension circuits are grounded. In general design these transformers resemble the transformers used in the high-tension tests at Telluride; the design and construction having been under the direction of the same man in both cases. The line extends from Provo at an elevation of 4500 feet to Mercur, at 2000 feet above Provo, and the line reaches an extreme height of about 10,000 feet above the sea level. Three miles of the line are strictly mountain construction. The lightning protection is afforded by choke-coils and Wurts non-arcing metal arresters. The insulators are of glass. The design was based on the tests at Telluride and they were made especially for this plant. The insulators are held on special pins of oak which are thoroughly paraffined. The lower part of the insulator is 5" above the cross-arm.

In dry weather there has been no difficulty whatever in operating. The insulators do their work as effectively as could be expected if the voltage were only a few thousand volts. When everything is dry, the line will operate without difficulty, even if some of the insulators are off and the wire rests upon the cross-arm. When it rains there is sometimes trouble. It is indicated in the station by the ammeters giving quick swings, showing momentarily strong currents. Sometimes this is apparently a short-circuit and blows a fuse. In every case when there has been trouble on the line it has been in rainy weather, and broken insulators have been found which located the trouble. It is certain that in most cases these have been previously broken by bullets, and in other cases it is probable that the insulators were likewise broken. It is believed therefore that had there been no intentional breakage of insulators there would have been no trouble upon the line since the plant began operating in February last. A few of the insulators near the station are not far from the overflow and are in a moisture equivalent to a rain all the time without doing any damage. Snow has often backed from the cross-arm up against the bottom of the insulator and around the first petticoat. It is usually found that the part of the insulator around and near the wire does not receive deposits of moisture or frost, but remains dry, the particles being repelled. At this plant current for about 700 H. P. is carried through three fuses of copper wire 0.01" in diameter. Iron wire is used on a branch line for transmitting about 100 H. P. for about three miles.

This plant has been in operation in winter and in summer, "in thunder, lightning or in rain," the sole supply of power for the enormous DeLamar mines and mills, at Mercur, and is a happy and fitting consummation of the high-tension tests described in the beginning of this paper.

Limitations of High-Voltage Transmission.—The important commercial question is: To what distance can power be transmitted? The relation between distance and voltage is well known. The same weight of copper can transmit with equal efficiency the same power to any distance, provided the voltage is increased directly as the distance is increased. The limiting commercial ratio between voltage and distance is easily found. If the distance be three miles per 1000 volts and the loss 16%, the cost of copper is about \$20 per H. P. The interest on the latter investment is about \$1 per year. A distance in miles equal to three times the number of thousand volts may therefore be covered without an excessive annual charge per H. P. for copper. The limits to the voltage which are practicable depend principally upon the insulator and upon the loss between wires.

The Insulator.—The two fundamental requirements are dielectric strength sufficient to prevent puncture, and a size and form which will prevent the passage of the current around the insulator. A given insulator will be adequate for a higher voltage where the atmosphere is comparatively pure and

dry than it will be under other conditions. The rapid progress which has been made in the design and construction of insulators during the last few years will doubtless provide an insulator which will accommodate the highest voltages that can be used due to other limitations. The insulator, therefore, while remaining the critical point in a transmission system, will probably not determine the limit of practicable voltages.

Loss Between Wires.—The loss between bare wires at high voltages seems to determine a positive limit, beyond which the voltage cannot be increased. This loss is subject to variation due to diameter of wire, distance between wires, and wave form of the E. M. F., but the variations which may occur under favorable commercial conditions locate the point of increase of loss about 50,000 or 60,000 volts. Under favorable conditions this may be raised somewhat, but it is not probable that any material increase can be made.

Amount of Power.—The amount of power to be transmitted involves some interesting commercial limits. There are certain elements in a transmission which do not vary greatly with the amount of power transmitted. Thus, the charging current to the line will be practically the same whether the wire will transmit 1000 or 100 H. P. If the charging current happens to represent 300 H. P., it would be insignificant in one case, but for the smaller output it would require generating apparatus several times that necessary for the actual power.

It is not mechanically practicable to use wires as small as would be sufficient, in so far as conductivity is concerned, for transmitting a small power. For example: a No. 7 copper wire, which is as small as is ordinarily used, if employed in a three-phase circuit fifty miles in length, will transmit over 1000 K. W. at 40,000 volts with 10% loss. If only a few hundred kilowatts were to be transmitted, the cost per K. W. would be excessively high, and, on the other hand, a lower voltage could be used without undue loss. In some cases, indeed, where a high voltage is used for small power, as for example on a branch circuit, an iron telegraph wire would have ample conductivity. In other cases an aluminum wire could be used to advantage, as an aluminum wire of the same conductivity as a copper wire has only about half the weight, and possesses greater mechanical strength in comparison to its weight.

It may also be noted that high-voltage transformers cannot be economically built for small output, as the insulation spaces required are so large. The cross-section of the copper is often not more than 10 or 20 per cent of the area of the opening in the iron. The cost per K. W. increases very rapidly when the size of transformer falls under a few hundred K. W.

Cables and Conduits.—The overhead transmission line has been considered, and its limitations are the insulating strength of the insulator and the losses through the intervening medium. In a cable or a conduit the insulation must be provided continuously instead of at points 100 feet apart. Rubber-covered cables are made for 10,000 and 20,000 volts, but it is quite possible that it will not be commercially practicable to make cables for much higher voltages. The effect of continued electric stresses on the insulation of the cable, which is an unknown factor, may prove to be a very important one. A conduit composed of a pipe containing oil, in which the wires are separated by glass tubes, has been proposed. Many mechanical difficulties arise in constructions of this kind; the cost is high and the action of continued high voltages on solids and liquids opens a field which is little known. A suitable insulation on the wires on high-voltage lines may enable higher voltages to be used than can be used with a bare wire.

Liquid air, with its high insulating properties and the low temperature and consequent high conductivity which it would give to a conducting wire, may enable us to use air insulation in a new way.

Difficulties and Precautions.—High voltages have been referred to in this paper with perhaps undue familiarity. Familiarity with high voltages is not one which breeds contempt. A voltage which can produce sparks several inches in length, which can be felt through several feet of air, which causes hissing sounds, which produces luminosity and which in a confined room generates strong odors of ozone, is one which creates profound respect. Dangers and difficulties accompany it and the highest intelligence, vigilance and excellence must be employed to avoid accident and ensure success. While ordinary types of construction do not seem to reach their limitations until some 50,000 volts is reached and pressures of this order have been and are in regular use, nevertheless they are not to be used indiscriminately or where they can be avoided. There are difficulties enough in handling 15,000 and 20,000 volts. As the pressure is raised the liabilities to trouble increase at an alarming rate. It is, however, a fact that these voltages have been and can be used, and also that no new or modified methods of transmission will be required before 50,000 or 60,000 volts can be employed for distances up to 150 or 200 miles.

THE Government report places the production of coke in the United States in 1897 at 13,283,984 tons, against 11,788,773 tons in 1896.

*Transactions American Institute Electrical Engineers.

Industrial Notes.

—In an order for 1200 freight cars given a Chicago firm is a specification for 5,500,000 ft. Pacific coast fir and spruce.

—An expert report on the Philippines finances says there are \$45,000,000 in circulation on a silver basis, and an export trade in '97 of \$41,000,000.

—Quicksilver exports from San Francisco for the first eleven months of '97 were 4913 flasks, worth \$174,405; for the same period in '98, 5769 flasks, worth \$311,533.

—Representatives of the Pacific Mail Steamship Co. are at Washington, D. C., trying to get a five-year contract for carrying the mails between San Francisco and the Philippines.

—Men are stringing four aluminum wires "about the thickness of a leadpencil" from Stockton to Blue Lakes, Cal., for the company that proposes to ultimately run its line into San Francisco and supply that city with light and power.

—J. J. Hill, Pres. Great Northern Ry., has bought the tax certificates on the old Union Pacific road between Tacoma and Portland. Prior to '93 the Union Pacific spent \$2,000,000 on this line and the abandoned work and property has been since held for taxes.

—Eastern papers say that "the longest telephone communication successfully established in the world" is now in operation between Boston, Mass., and Little Rock, Ark., 1900 miles. Similar facilities have for some months been established between San Diego, Cal., and Boise, Idaho, 2300 miles.

—Consul Williams writes from Manila that during the three months ended Sept. 30, 1898, the value of the declared exports from that consular district to the United States were: Hemp, 4000 bales, \$57,508.35; hats, 19,808, at 20 cents, \$3960.00; cigars, 34 cases, \$1329.92; grass cloth, \$156.41; total, \$62,950.27.

—There was about \$3,500,000 in the Spokane, Wash., banks last week, and the bankers did not know what to do with it. There has not been a bank statement for two months, but when the last was made the banks were carrying about 65 per cent. Soon, by reason of the Le Roi sale, about \$4,000,000 more money will be thrown into the Spokane banks.

—At Topeka, Kansas, on the 8th inst., the board of directors of the Santa Fe Railway Co. made formal approval of the purchase of the San Joaquin Valley line, by which the Santa Fe will run trains into San Francisco. The chairman of the board said that the war had opened greater possibilities for the West, and that San Francisco will be a much more important point to the road than it has ever been.

—The town of Republic, Wash., claims to be the banner town in the United States for sending registered matter through the mails. Up to Nov. 11, in the present quarter, there were 350 registrations. For the same period one city with 110,000 population had only 345 to its credit. So great has been the registration that the postoffice authorities upon one occasion sent a letter of inquiry, thinking an error on the part of the postmaster had been made. The figures astonished the department.

—On the 7th the Secretary of War sent to Congress the reports of the engineers who have been examining the Sacramento and Feather rivers, Cal., with the idea of their improvement. The report finds that it is possible, by means of wing dams and dredging, to make a channel with 7 feet to Sacramento, 4 feet to Colusa and 3 feet to Red Bluff, at a cost of \$280,000 for the first section and \$25,000 for the last two sections. It is decided that in the Feather river no work is advisable until the flow of debris is stopped.

—The new executive committee of the Cal. State Miners' Association met on the 7th in San Francisco. The Secretary was authorized to expend \$200 in furnishing an office. It was decided not to have the Association headquarters in the new ferry building. It was ordered that county associations that have failed to pay the required 75% to the State Association be immediately called upon for such amount. A motion was carried that the coming State Legislature be asked to set apart one-third of its Paris Exposition appropriation for the purpose of a mineral exhibit there.

—A tariff for shipments over the Siberian Railroad as far as Irkutsk has been published. Irkutsk is the great trade center of Siberia, and the western terminus of the Chinese caravans over the desert, which have forages brought a large part of the tea consumed in Russia. The new tariff on tea from Irkutsk to Moscow is 2½ rubles per pod, with a separate charge of 3 kopeks per pod for crossing the Yenissei and 2 kopeks for crossing the Oka—great rivers where the bridges are not yet completed. This is at the rate of \$3.30 per 100 pounds. The rate on high class freight in the other direction is about the same. The distance from Moscow to Irkutsk is about 3400 miles.

—At Phoenix, Arizona, it is estimated that enough water is wasted from Salt river each winter to irrigate 1,000,000 acres in the Salt river valley. It is proposed to store these winter floods, to be drawn from as needed during the summer months, by constructing a reservoir in the mountains sixty miles north-east of Phoenix. The U. S. Government has granted the Hudson Reservoir & Canal Company the Tonto basin, to be used as a storage reservoir. It proposes to build a dam at the head of the canyon where the river emerges from the basin, creating a lake eighteen square miles to a depth of 100 to 200 feet. It will be necessary to build a dam 200 feet high and some 600 feet in length at the top, al-

though the canyon is only 200 feet wide for the first 100 feet from the bottom. The Territory of Arizona has granted the company the use of the channel of the Salt river to convey the water to the valley below. To construct this storage reservoir, the largest in the world, will cost about \$2,500,000.

—The total value of the imports in Apia, Samoa, in 1897, according to the American consul-general, was \$329,630, of which nearly half (\$157,695) was from the Australian colonies. The United States sent goods to the value of \$53,415. The exports amounted to \$239,198, of which \$125,350 went to Europe, \$54,305 to the United States, \$51,473 to Australasia, \$14,223 to Hawaii, etc. Of copra (native product) 10,691,520 pounds were exported from Samoa. The consul-general adds that a large percentage of the goods from Australia are of American origin. It is stated that all goods originating east of California are sent to the Atlantic seaboard, thence to Sydney, and from Sydney to Apia, and are delivered there cheaper than they can be obtained directly from San Francisco.

—For the ten months ended October 31, the Oil Producers' Trustees of Los Angeles, Cal., sold 223,647 barrels of crude oil, for which they received \$165,164.76. The largest quantity sold in any one month was 83,007 barrels in March, and the lowest average net price per barrel paid to producers, members of the trust, was 51.28 cents in May. The highest net price was that of October when the producers received, all expenses deducted, 82.06 cents per barrel for their oil. The Times says that the present production of the Los Angeles field is 2300 barrels a day. Consumption, including shipments to points outside of the city, averages 3000 barrels, a shortage of 700 barrels a day. Local consumption is about equal to production.

—The Chief of the Bureau of Yards and Docks, in his annual report, says: "If it be important that this country equip a first-class naval station or yard in this vicinity, near the limit of its boundary, which the Bureau believes, then another site should be sought, which combines the essential requirements of such yard in near-by population, supplying enough skilled labor, a market with supplies conveniently and quickly available, and direct railroad connection with a trunk line for quick and economical transportation of material." The logic of events during the last seven months has demonstrated that more than half of the United States navy will always be kept in the Pacific. Expansion has come to stay—not only in territory, but in commerce.

—In Congress yesterday Senator Morgan submitted a report on the present situation of matters with reference to the Nicaragua canal, the report being a result of the meeting of the Senate committee on the canal. In the report it was asserted that the recent action of Nicaragua in granting a concession to another company than the Maritime Canal Co. was unjustifiable and was an act of unfriendliness to the United States to which this country should not submit, as all three parties interested—the United States, Costa and Nicaragua—should have been consulted before such a change was made. Senator Morgan gave notice of an amendment to the canal bill, authorizing the issue of \$5,000,000 worth of bonds, guaranteed by this Government, for the redemption of all outstanding stock and cancellation of all indebtedness.

—"The scarcity of labor all over the Republic is becoming a serious question to the railroad companies that are building new lines and extending old ones, and the contractors are getting very anxious, as there is no relief in sight," says the *Mexican Financier*. "All the roads in the Republic are complaining of the scarcity of labor, and one or two have been compelled to stop work completely, as they had no men to go on with construction. The International is feeling the scarcity in a marked degree, and work on their branch to Monterey is being greatly delayed. The National is also experiencing difficulty in securing men on its Urupuan extension, and the Central cannot get enough men for its Tampico division, which is undergoing extensive repairs and betterments. The average amount per day paid for men is 75 cents, though in a number of places \$1 per day is offered and paid whenever men can be gotten to accept the price. The rate can be appreciated when it is known that any number of men can be got to work on farms and haciendas at 25 cents per day, and the same men will not work on a railroad for less than \$1 per day. The reason is that in the latter position they are required to work hard and steady."

—A contributor to a Russian magazine has published an article setting forth the necessity of organizing a Russian steamship line on the Pacific ocean, in order to establish communication between Siberia and the United States, to connect with the Siberian railroad. The same author goes on to say: "Foreigners have already established three new steamship lines, having Vladivostok as a terminal point. One of these—the American-Japanese—has for its western terminus San Diego, the most southern port of California, and will work in connection with the Atchison, Topeka & Santa Fe Railroad. The steamers will also call at Honolulu. The second—the English-Canadian—will work in connection with the Canadian Pacific Railroad Co. and sail from the cities of Vancouver and Victoria. Two of its large steamers, about 5000 tons each, will run regularly from these cities to Hakodadi and Vladivostok. The line is controlled by the Canadian railroad and the Empress Line. The reason for its establishment is said to be the rapid development of the Russian Pacific coast and the Siberian railroad and the demand for American products, among others wheat, flour, timber and materials for railroads and factories. The third line belongs to the North German Lloyd of the Bremen

Steamship Co. It has not yet selected its terminus; its directors are hesitating between San Francisco and Los Angeles. The longer Russia remains inactive in this direction, the smaller are her prospects of occupying the place which is due her in the transcontinental and oceanic traffic. This inactivity will greatly influence the future well being of the great Siberian railroad." Passengers and mails can reach Vladivostok via the Vancouver route in thirty days from St. Petersburg, while it required thirty-five days via the Trans-Siberian route, 1151 miles of which is made in partially closed conveyances on rough roads, traveling night and day. By the usually traveled route the trip requires forty-five days. The Trans-Siberian railroad will be about 3644 miles in length when completed; 2015 miles are completed from St. Petersburg side and 478 miles from the Pacific coast, or Vladivostok end, leaving 1151 miles to be built. The construction is going on at the rate of 331 miles per year.

Personal.

J. HANLON is Supt. Crown Point mine, Phoenix, Arizona.

W. H. STORMS, Supt. Agnes mine, Sonora, Cal., is in San Francisco.

F. W. WILMANS, Supt. Star mine, Sonora, Cal., has returned from San Francisco.

D. R. OLIVER, part owner Bonanza mine, Sonora, Cal., has returned from San Francisco.

D. KEITH becomes Gen. Mgr. Star Con. mine, Tintic, Utah. W. Lawrence is slated for Supt.

GEO. MAINHART, Supt. Omaha Con. mines, Grass Valley, Cal., has returned from San Francisco.

A. M. McDONALD, Supt. Republican mine, Jacksonville, Cal., has returned from San Francisco.

C. H. KALSRUHR of Cincinnati, Ohio, Pres. Phoenix M. Co., Nevada City, Cal., is inspecting the mine.

JOHN W. MACKAY, accompanied by W. R. Eckart of San Francisco are at the Grand Reef mines, Globe, Ariz.

JOHN F. KIDDER of Grass Valley, Cal., has been reappointed State Debris Commissioner. The salary is \$3600 a year.

E. ROBERTS of Boston left Salt Lake City last week en route to Angels, Cal., to examine properties upon which he has an option in that neighborhood.

VICTOR M. CLEMENT succeeds Hartwig A. Cohen in the management of Capt. De Lamar's mining interests at Mercur, Utah, and De Lamar, Nevada.

R. B. WATSON, Supt. Marsac, Utah, mill and refinery has resigned to take charge of a big copper-silver mining and milling property at Ramos, San Luis Potosi, Mexico. He is succeeded by G. D. Blood of Berkeley, Cal.

Recently Declared Mining Dividends.

Calumet & Hecla, Michigan, \$10 per share, \$1,000,000; payable Dec. 23.

Swansea, Utah, 10 cents per share, \$10,000; Dec. 10.

Grand Central, Utah, \$31,250; Dec. 10.

Silver King, Utah, \$37,500; Dec. 10.

Yellow Aster M. Co., California, for October, \$10,000; payable immediately.

Nugget G. M. Co., Colorado, 2 cents per share, \$20,000; Dec. 10.

Tamarack M. Co., Michigan, \$4 per share, \$240,000; payable Dec. 23.

Olive G. M. Co., Ontario, 1 cent per share for October and 1 cent per share for November; payable Dec. 15.

Hale & Norcross, Nevada, \$1.50 per share, \$168,000; Dec. 6.

Recent Mining Incorporations.

Columbus Con. G. M. Co., San Francisco; capital stock, \$300,000; subscribed, \$700; G. Ghiglieri, L. Oliveri, D. Brushi, C. Garbani, G. Demartini, G. Bovo, C. Dondoro.

Boston and California G. M. & M. Co., San Francisco; capital stock, \$600,000; subscribed, \$300,000; N. Hansen, G. Gall, L. M. Gall, J. C. Jens, A. M. Jens.

Exposed Treasure M. & M. Co., Los Angeles; capital stock, \$100,000; subscribed, \$37,750; A. N. Davidson, J. A. Osgood, M. L. Wicks, A. M. Davidson, M. J. Conway, J. E. Davis, E. G. Fay.

McKinley-Spartan Con. M. & M. Co., Stockton; capital stock, \$50,000; subscribed, \$32,975; W. B. Shuler, J. W. Empfield, P. Miller, J. M. Meseroll, E. L. Rehm.

Bonita G. M. Co., San Francisco; capital stock, \$100,000; W. Angus, C. S. Neal, G. L. Bresse, G. E. Crothers, F. G. Crothers.

Uncle Sam M. Co., San Francisco; capital stock, \$100,000; subscribed, \$70,000; B. L. Davis, O. Hoffman, J. W. Richards, C. P. Grimwood, F. H. Gould, W. Mooser, G. G. Frazer.

The Caledonia M. Co., San Francisco; capital stock, \$200,000; subscribed, \$50; F. V. Bell, F. H. Smithson, J. J. Kerrigan, I. H. Ward, C. A. Reynolds.

The Black Sand M. Co., San Francisco; capital stock, \$100,000; all subscribed; L. Bowles, A. B. Fay, J. H. Sayre, H. Laurence, J. F. Long.

The Sylvester Quartz M. Co., Sacramento; capital stock, \$50,000; subscribed, \$30,000; F. H. Atkinson, G. H. Clark, S. E. Shear, J. M. Avery, J. B. Fountain.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 23, 1898.

615,124.—CERAIN HANGER—Rebecca Alexander, Fresno, Cal.

615,211.—HYDROCARBON BURNER—J. P. Call, Redondo, Cal.

615,058.—FOOT REST—W. E. Cummings, Los Angeles, Cal.

615,153.—GOLD SEPARATOR—A. T. Fox, Sumner, Wash.

615,167.—BOOT AND SHOE HEEL—C. G. Hainline, Anderson, Cal.

615,177.—GRAIN PEARLING MACHINE—J. C. Holloway, S. F.

614,957.—NECK YOKE, ETC.—J. Journeay, New Hope, Cal.

615,085.—CONSTRUCTING FLUMES—Martin & Ormand, Riverside, Cal.

615,194.—SHUTTERS—J. Parkinson, Los Angeles, Cal.

615,100.—CARBURETOR—E. D. Parrott, Goldendale, Wash.

614,976.—RAILWAY RAIL—J. W. Peterman, Banta, Cal.

614,888.—HOSE COUPLING—J. C. Poetz, Spokane, Wash.

614,907.—VEHICLE PROPELLER—J. F. Venner, Brownsville, Or.

615,120.—PRESSURE REGULATOR—J. C. Witt, Phoenix, A. T.

614,921.—TREE PROTECTOR—C. Zimmerman, Santa Rosa, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PNEUMATIC BOOT AND SHOE HEEL AND CUSHION.—C. G. Hainline, Anderson, Cal. No. 615,167. Dated Nov. 29, 1898. This invention is applicable to boots and shoes. The object is to combine the elasticity of a rubber or other elastic heel with the additional elastic support provided by a body of air contained in a suitably closed cavity within said heel. It consists of a rubber heel having an open-topped chamber formed in the upper part, with a peripheral margin adapted to be cemented directly upon the sole of the shoe, so that a body of air is hermetically sealed within the chamber to form an independent elastic cushion. A groove or channel is made around the outer periphery of the heel and nails may be driven through said channel to secure the heel, leaving a central projecting elastic surface of contact with the ground, interior to the line of nails.

GRAIN PEARLING MACHINE.—J. C. Holloway, San Francisco, Cal. Assignor of four-fifths to J. F. Cunningham and Charles E. Grosjean, of same place. No. 615,177. Dated Nov. 29th, 1898. This invention is designed to carry out the operation known as pearling barley and other grains. It consists of a mechanism in which a continuous feed and discharge may be effected in which it differs from other machines hitherto employed for the purpose, in which the grain to be treated is worked in independent charges, each charge being completed and moved before a new charge is introduced. This apparatus comprises cylinders separated from each other to provide a confined passage for the grain, one of said cylinders having end heads and an imperforate circumference, and the other having an abrading or roughened surface opposed to the surface of the first named cylinder. The inner cylinder is mounted upon a shaft and the heads of the outer cylinder turn loosely with relation to the inner cylinder having inwardly turned flanges which enclose its ends. Openings are provided for the passage of the grain to and from the space between the cylinders which are rotated in the same direction at different rates of speed. A supply hopper connects with the openings at one end, and a stationary casing encloses each of the apertured heads, the casing at the opposite end having a discharge opening through which the grain may pass. A body of grain is thus kept moving slowly between the cylinders at all times, the supply from the feed end being regulated by the rapidity with which the grain is discharged from the opposite end.

Commercial Paragraphs.

"ENCLOSED ARC LAMPS" is the title of the latest pamphlet issued from the General Electric press. It deals with the different types of enclosed arc lamps manufactured by the General Electric Company for direct and alternating current circuits, indoor and outdoor lamps, marine lamps, miniature lamps, power circuit lamps, series enclosed lamps, and single-globe and double-globe lamps. Each type is well illustrated, and the object of its design and its advantages set forth in language unhampered by abstruse technical expressions. It is written for the information of the general consumer as well as the electrician. Printing and illustrations are, as usual, excellent. The pamphlet will be sent to persons interested on application to any of the sales offices of the General Electric Company.

Current Mining Cases.

Prepared for the MINING AND SCIENTIFIC PRESS.

A locator may relocate his mining claim, including additional vacant ground unclaimed by others, under a different name, and convey it by the designation of the last name. *Shoshone Min. Co. vs. Rutter*, 87 Fed. Rep. 801.

"Sand" is a mineral, within the meaning of Act May 8, 1876 (P. L. 142), and an indictment lies for its removal from above ordinary low-water mark of an island in the Susquehanna river. *Commonwealth vs. Hipple*, 7 Pa. Dist. R. 399.

An assignment by one partner to a creditor, as security for a pre-existing individual debt, of all his interest in the mining leases and partnership property, does not avoid the partners' lien on the property. *Ervin vs. Masterman*, 16 Ohio Cir. Ct. R. 62; *Townsend vs. Same*, Id. 77.

The terms "vein" and "lode," as used in the various Acts of Congress relating to mining locations, apply to all deposits of mineralized matter within any zone or belt of mineralized rock separated from the neighboring rock by well-defined boundaries. *Hayes vs. Lavagnino*, 53 Pac. Rep. 1029.

The Revised Statute of the United States, Section 2320, providing that "no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located," does not require the locator of a mining claim to be the original discoverer of the vein or lode. *Hayes vs. Lavagnino*, 53 Pac. Rep. (Utah), 1029.

In a suit to determine the right of possession of a mining claim it is incumbent upon the locator to show that the location was made upon a vein or lode of quartz with knowledge on his part, before the location was made, of the existence of mineral there. *Hayes vs. Lavagnino*, 53 Pac. Rep. (Utah), 1029.

The Revised Statute, Section 4112a, providing that oil or gas leases or assignments thereof shall not be valid unless recorded as therein provided, does not prevent the taking effect or enforcement of the partners' lien upon such property, though the title may be held in the name of an individual. *Ervin vs. Masterman*, 16 Ohio Cir. Ct. R., 62.

A stipulation in a coal lease that the lessees shall mine and ship each year as much coal as will produce \$5000 yearly at the rents designated, unless prevented from doing so by unavoidable accident, or occurrences beyond their control, releases lessee's liability for rent when coal on the premises becomes exhausted. *Bannan vs. Graeff*, 40 At. Rep. (Pa.), 805.

Seams containing mineral-bearing earth and rock, discovered on a claim before its location, were similar to seams that had induced other miners to locate claims in the same district, and which by development had proved to be a part of a well defined lode or vein containing ore of great value. *Held*, a sufficient compliance with Revised Statutes, Section 2320, requiring the discovery of a lode or vein within the limits of a claim before a valid location thereof can be made. *Shoshone Min. Co. vs. Rutter*, 87 Fed. Rep., 801.

Under Acts of Congress, July 26, 1866, and May 10, 1872, relating to the location of mining claims, any deposit of mineral matter, or indication of a vein or lode, found in a mineralized zone or belt, within defined boundaries, which a person is willing to spend his time and money to follow, in expectation of finding ore, is the subject of a valid location, and, when the metallic vein matter appears at the surface, leads may be made. *Hayes vs. Lavagnino*, 53 Pac. Rep. (Utah), 1029.

Co-owners of an oil and gas lease of certain lands agreed to form a partnership for the sinking, equipping, and operating oil wells thereon, the necessary funds to be raised by assessments upon the members, and each member to receive and sell on his account and at his own pleasure his share of the oil produced; and in pursuance of this agreement a firm name was adopted,

and the business carried on accordingly. *Held*, that this arrangement constituted a partnership, to such an extent as to allow parties to transfer their share without consent of their co-partners, and without working a dissolution, partaking in the nature of a mining partnership; and hence that the partners' lien might be enforced as in the case of an ordinary partnership. *Ervin vs. Masterman*, 16 Ohio Cir. Ct. R., 62.

The Torpedo Boat Farragut.

The torpedo boat Farragut, herewith depicted, built by the Union Iron Works of San Francisco, at her official trial trip last Saturday made 30.18 knots over the official course, 419½ rev-

TORPEDO BOAT FARRAGUT.

olutions—30 knots, 417 revolutions were required. This attained speed of thirty-three miles per hour makes the Farragut the fastest of her class. The same men that built the Oregon built the Farragut; the big battleship, whose fame is now world wide, has motive power weighing 1009 tons, developing 11,111 H. P.; that of the little torpedo boat is 120 tons, but develops a H. P. of 5600.

In connection with this record of California mechanism, it is interesting to note that the United States navy now has thirteen of those little craft, and several more whose official trial and subsequent acceptance have been delayed. The nearest in speed to the Farragut is the Porter, with a record of 28.68 knots. She is of 165 tons, and cost \$144,000. The Farragut is 240 tons, and cost \$227,500.

Side-Dumping Ore Cars.

The accompanying cut is from a photograph of an all-steel construction side-dumping ore car, manufactured by the American Engineering Works of Chicago, Ill. These cars are equipped with Anaconda self-oiling wheels and axles. The car box, as

SIDE-DUMPING ORE CAR.

shown in cut, is 48 inches long, 36 inches wide and 24 inches deep; height from top of rail to top of car 44 inches when equipped with 14 inch wheels; shipping weight 1200 pounds; frames are made of 5-inch channels; ends and

sides of box No. 10, bottom and door ½ inch hard-finished steel plates, fastened in the corners with 2x2 angles, re-enforced around the top with 1½ inch angle, which also is used in re-enforcing the door. The body of the car swings on cast iron trunnions, which are fastened to the box with 5-inch intervening channels, and the frame of car by ½ inch plates. Car dumps at an angle of 45° or more, as may be desired. It is operated by lever, as shown in the cut. When the latch is thrown forward it unhooks from the body, at the same time unhooking the door. Draw bar is made of wrought iron, running clear through and fastened to the frame at both ends. The photograph shows bumpers, which have been put on special cars for run-

ning in trains of twenty or thirty. Generally the car is furnished without bumpers. This same type of car can built in any size or style to suit requirements.

New Tire Remover.

Blacksmiths often wish to remove a tire from the wheel without cutting

NEW TIRE REMOVER.

the tire, but they find it difficult to do this without injuring the wheel. And this is particularly so in the case of

Chicago has a tire remover herewith illustrated. The pressure is exerted by a screw, the end of which turns in a round block resting on the felloe. A square block is provided, upon the edge of which the tire rests. On this block are four shoulders of different widths, the object being to turn to the front the shoulder having the right width of the tire. The body is malleable iron and is strong enough for any pressure that the work may require.

L'Electricien announces what it styles "an important discovery, which will shortly revolutionize lighting by electricity." It is incandescence in the air. Patents have been taken out, in various countries, by Ganz Bros. of Budapest, who are now endeavoring to perfect this new mode of lighting. An aluminum tube, three-twelfths of a millimeter, receives the current through two small platinum wires, the tube becoming effulgent on the passage of the current. No glass bulbs are needed, and the light, it is claimed, is more effulgent, while the cost is appreciably less. Aluminum tubes have undergone incandescence during a period of 700 hours, without showing any physical or chemical changes. The only difficulty was that aluminum is not a conductor of current in its cold state. The difficulty has, however, been overcome by the heating of the tube, which is run automatically. A small coil of platinum wire is brought into touch with the aluminum tube, and as soon as the current passes, this coil immediately becoming heated, communicates its warmth to the tube, from which it is released automatically. It would seem, from experiments made so far, that the new system is satisfactory.

To prevent the engines of a vessel from "racing" when the screw rises above the water, an electrical regulator has been invented which consists of two vessels of mercury connected at the bottom by a tube and mounted fore and aft in the ship. The vessels are half full at normal depth. When the

ship pushes forward so as to raise the screw, the rods connected with the resistance are submerged one after the other, so that an electro-magnet is brought into play, the whole resistance being short-circuited when the screw is entirely out of the water. The electro-magnet operates a throttle valve in the main steam pipe, which is thrown open by another magnet. By this arrangement the steam is turned off and on. From experiments it has been shown that the mercury vessels need not be more than 34 inches apart on a ship 300 feet long.

At Paris a stone saw of the circular kind, 7 feet 6 inches in diameter, is set with 200 diamonds let into the metal and disposed of in such a way that eighty stones are set into the points of the saw teeth, eighty more into the faces of the teeth near their points and forty more into the side of the teeth. The saw rotates at the rate of 300 revolutions per minute; its tangential speed is of 120 feet per second, and it cuts into the stone at the rate of a foot per minute for the hard-faced stones; for soft building stone the saw makes but twelve revolutions per minute, advancing 40 inches into the stone during that time. The stones are mounted on a chariot, the movement of which can be regulated to suit the advance of the saw. Blocks up to 6 feet high by 4 feet wide can be cut like so much wood.

Mining Summary.

ALASKA.

New regulations have been adopted for hydraulic mining in the Yukon. The areas are to be from one to five miles in length and will be granted only by public tender. Exception is made, however, in the case of parties from the Klondike who have already applied. They are treated as pioneers, and not only get their concession without competition or payment of bonus, but are exempted from dues. These dues are \$150 a year per mile frontage and obligation to perform assessment work yearly to the value of \$5000. On all commissions, however, the usual royalty will be collected on an output of over \$25,000 a year. It is expected this royalty will be reduced to 2 per cent. Other conditions are that the applicant furnishes proof of having resided in the Yukon and file a certificate that he has examined the ground applied for, prospected it and ascertained that it is not suitable for mining by ordinary placer methods.

ARIZONA.

C. Polhamus last week received good assays on ore from the Refugio mine in the Mesquite district.

Tucson Citizen: The sale of the San Xavier mines, owned by Goldschmidt & Manning, to some of the owners of the Kansas City Smelting Works is announced, the reported price being \$200,000. The mines are near Tucson and a good deal of development work has been done on them. The ore, though not of high grade, lies in large bodies. About 10,000 tons of it have been shipped to El Paso and the Kansas City Smelting Works.

Yuma Sun: O. F. Place is developing the Buckeye mine, in Yavapai county.—The Gopher G. M. Co. has started work on Chaparral properties with twenty men.—The Swindler mine is proving to be a copper property.—Good ore is being taken out of the Bedrock mine, in Peeples valley, and hauled to the Yarnell mill.—A depth of 300 feet has been reached in the Red Rock mine. A stamp mill has been secured; twenty men are employed.—A. O. Brodie is developing his Crown Point mine with twenty-five men.—In Pinal county the Mammoth G. M. Co.'s payroll contains 100 names.—A shaft is being sunk on the Georgiana copper mine, near Florence. It is in good ore.—The shaft on the ledge of the Grand Reef mine, Cochise county, has been sunk 475 feet, and a tunnel is being driven to strike the 400 level. It is being developed on a big scale, with the aid of improved machinery, and, when thoroughly exploited, mammoth reduction works will be erected.—Cochise county's greatest gold producer is this year all the ore of the Commonwealth was shipped, but now a 20-stamp mill crushes all except the very richest.—In Mohave county, the ledge of the Blackfoot, owned by B. Collins, will be crossed by a tunnel at a depth of 450 feet.

—Near White Hills, C. Latin and partners have found placer ground, which they are working with dry washers.—Twenty-five men are working on the Azurite, in Pima county.—A body of ore is being developed in the Santa Maria mine, near Arivaca.—Copper sulphides have been found in the company's property at Rosemont.—The Blue Jay mine is producing high grade ore.—At the Cardinoff mine, in the Ojo district, A. J. Shotwell of Denver will build a 40-ton reduction plant soon.—The Silver Bell smelter, operating on ore from the mine of that name, near Tucson, reduces twenty-five tons of copper-silver ore daily, and produces about three tons of copper bullion and matte. About seventy-five men are employed.—The Red Cloud mine, in Yuma county, is developed by five shafts, the main one being 590 feet and the others from 150 to 300, all being connected by stopes and drifts. From the third level four winzes have been sunk to a depth of 490 feet. The water level is struck at a depth of 555 feet. H. P. Griswold is taking out ore above and below the third level. The ore body is from 2 to 14 feet in thickness and the pay streak carries 60 per cent lead and over 100 ounces in silver to the ton.—P. Singleton of the Yellow Aster mine, Randsburg, Cal., has bought a mining property near Yuma, which yields good assays as development progresses.—The Clifton mine, near Yuma, has three shafts to a depth of 300 feet and a 125-foot tunnel. There are two veins on the claim, running parallel and averaging 5 feet in width. The ore taken from this property averages 55 per cent in lead, and much of it carries 350 ounces of silver per ton.—The Ajo copper mines, in Yuma county, have been secured by Eastern mining men, and work is to be inaugurated there soon, under the supervision of C. C. Bean. The ore of these claims also carries gold values.

CALIFORNIA.

Amador.

Secretary Baker of the Alma G. M. Co. says there is a probability of reopening the Alma mine soon.

Sutter Creek Record: Twenty stamps started at the Balliol mill at Sutter Creek last week.—The Keystone 40-stamp mill at Amador City is running full capacity.—At the Wildman-Mahoney mine the Mahoney's forty stamps are dropping and twenty are crushing at the Wildman. The Emmerson shaft is down 340 feet.—At the Douglas mine in Volcano district they began a station at the 400 level.—At the Lincoln mine, Sutter Creek, the old shaft, which is 800 feet deep, has been cleaned and retimbered to 400 feet. The mine employs twenty men and \$3000 per month is disbursed. Supt. Voorheis expects to erect a big mill on the property next spring.

Jackson Republican: From the Spagnoli mine, near Jackson, ore amounting to several thousands of dollars has recently been taken out.—Sinking continues at the Zella. Supt.

Detert expects to go 700 feet deeper, and, if the prospects are not satisfactory, work on the upper levels will be started.

Jackson Dispatch: The new shaft at the Kennedy mine is under way. A large force is employed.—At the South Eureka mine, Supt. Parks is opening the 1600-foot level, which will be driven from the north shaft. It will take five months to complete the work.—Near Pine Grove the Fisher mine has been yielding good ore the last two weeks. The mill is running day and night.

Jackson Ledger: At Volcano the old Downs mine is to be reopened.—J. B. Meek has bought the Grizzly Hill gravel mine near Volcano and will begin work as soon as it rains sufficiently.

Butte.

Oroville Register: Near Oroville, the Hammon dredge is at work digging and washing gravel. It is 150 yards from the river in a canal that it has cut for itself. Near this is the Plutos, 46 feet wide and 65 feet long. It will be ready for work in a short time.—A road to the Chambers mine has been built, and machinery is being hauled for the mill, which they hope to have running Jan. 1.

Calaveras.

At the Gwin mine, near Mokelumne Hill, grading has been begun for an additional thirty stamps.

San Andreas Citizen: The California Exploration Co. are extending their electric wires to the Ford mine. The new mill will be operated by electric power.—Near El Dorado the Folsom gravel claim will be worked. Water will be secured from Emery's ditch, and a line of pipe 4500 feet will be laid at once. With the first rains work will begin.

—The ditch for the Lively mine has been cleaned out and awaits rain to operate the plant. The mill has been shut down two weeks, owing to financial difficulties. Indications point to the beginning of work shortly.

San Andreas Prospect: Work is progressing at the Chili Hill gravel mine at Central Hill. Last week the old works were tapped and the water raised 40 feet in the shaft. The connection was expected and no accident happened. The shaft is being unwatered. The developments revealed a large quantity of gravel.—Although the Sheep Ranch mine has been practically closed down for some time, the indications are that work will soon be resumed.

Angels Echo: It is reported in Angels that work in the Thorn mine has been discontinued and that the machinery will be removed. The company who recently took charge of the Collier mine, near Murphys, are making extensive improvements. A 5-stamp mill was started last week. The ledge is from 3 to 6 feet in width and it is said the ore will yield \$35 a ton.

Colusa.

The Empire Quicksilver M. Co., near Williams, is erecting a forty-ton furnace and retorts on the old Abbott mine, leased by the Empire Co.

Del Norte.

At the Blue Ledge mine near Crescent development work will continue all winter.

El Dorado.

Placerville Democrat: The company who recently bonded the Selby mine, near Diamond Springs, are arranging to sink to 1000 feet depth.—A good pay chute has recently been struck in the 300 level at the Larkin mine and five stamps have been added to the mill, making ten stamps.—The dynamo for the Griffith was taken to the mine last week.—The Marguerite mine has uncovered some good ore.

Fresno.

A discovery of 30 per cent copper ore is reported from Clovis. The mine is owned by Bland & Burton.

Kern.

Randsburg Miner: T. Johnson has sold a three-quarter interest in his copper mine at Pilot Knob and is in Kansas City, Mo., closing the deal. He gets a satisfactory price for it, with a large cash payment, and is to remain as Supt. of the property.—F. Goodman represents a company from New York developing the Copper City Camp near Johannesburg. They have a large force at work.—Pebby Bros. of San Francisco are mining near Ballarat.—The Red Dog mill has been running on ores from the Gold Coin and Butte the past week.—Walker & Co. had a nice cleanup from a 6-ton run from their lease on the Butte.—Squires & Perdue on their Alpha claim have an 18-inch ledge of high-grade ore.—The Black Hawk mine is making a 50-ton shipment of ore to the Cuddeback mill. They are now taking out about five tons of good ore a day.—C. Collins' ore dump on the O. K. is assuming good proportions.

Los Angeles Review: In the Windy mine near Randsburg a 30-inch body of ore running from \$300 to \$400 per ton was encountered.—The Wedge has had ore crushed at the Eureka mill that has yielded \$100 a ton. The same mine is also having some low-grade rock run at the Johannesburg mill.—At the Yellow Aster the new mill will be in operation shortly after Jan. 1.—The Butte is preparing for a big mill run on high-grade ore, and shipping several hundred tons of low-grade ore.—The Kinyon is taking out some high-grade ore.—The Little Butte continues in good ore in the lower levels and is milling at their own mill at Johannesburg, and also at Barstow.—Willard & Harrison removed their Cuddeback mill to the Black Hawk mine near Johannesburg. It will be in operation Jan. 1. The Black Hawk people will use it for several weeks.—At the O. K. mine, recently bought by A. R. Collins for himself and New York associates, sinking on the large ore body has begun.—Campbell, Denniston & Woodard, who recently bonded the Rader property near the Yellow Aster group, have uncovered a number of ledges of high-grade ore.—C. A. & A. A. Burcham have started extensive work on some claims they recently bonded in the Argus country.—C. Koehn, who has a lease

on the Ruby claim near Johannesburg, has a force at work sinking and drifting, and is shipping from twelve to twenty tons of \$20 ore to his mill at Kane Springs.—It is reported on good authority that the Yellow Aster output for November exceeded \$70,000.

Mariposa.

(Special Correspondence).—The Big Betsy mine, operated by the Golden Crown M. Co., comprises six claims. The property is in this county, on the Tuolumne county line. The postoffice is Groveland. Work was begun about a year ago. The shaft has reached 300 feet and is reported to be in ore all the way. The average size of the ledge is said to be 14 feet. An assay made from this ore in Chicago indicated a value of \$72.93 to the ton, with a good percentage of sulphurets. Water will be used for power. It will be pumped from the mine and stored in a large reservoir. The company is building a 10-stamp mill, which is expected to be in operation Jan. 15, '99. Compressed air will be used for drills and the pump on the lower level. The pump on the surface throws 500 gallons a minute. The company is composed of business and professional men of San Jose. It is capitalized at 300,000 shares at a par value of \$1 each. The company is organized on a safe basis and its plant and property are free from any indebtedness. The president of the company is W. O. Hilbish; secretary, A. McDonald; treasurer, E. H. Wemple. A. McDonald is Supt. The property is being developed for its stockholders, and not for the market.

Mariposa Gazette: M. Bogart has bought the North Doss mine, near Hornitos.—M. L. Rodgers and assayer King of Mt. Gaines are prospecting the Green Valley mine with intent to buy.

Napa.

In November 1004 flasks of quicksilver were shipped from the Napa county mines.

Nevada.

Work has begun towards putting a dynamo at the Allison Ranch mine, near Grass Valley, to run the air compressor. The line is being surveyed for the poles, and it is expected that the machinery will be ready in three weeks.

Nevada City Transcript: The new bedrock tunnel of the North Bloomfield Co. is being pushed up the channel. A pthole was encountered recently, but within a short time that will have been passed and the extraction and washing of gravel will begin.

Grass Valley Union: The old McCutchan hydraulic mine, near Nevada City, which is being opened by Gray & Bullard, will probably be running by Christmas. Men are building a dam, which is over half completed. The pipe line is about finished and they are putting in 2000 feet of sluice boxes, after which the mine will be ready for the monitor.

Grass Valley Union: The owners of the South Fork mines near Grantville have paid the liens against the property, incurred by the Netherlands Co. while they had the mine under bond. There is a new mill on the mine, which is owned by Fowler & Miller, and there is a possibility of the mine resuming operations in the spring.—Operations have resumed on the Granite Hill mine, near Grass Valley, with E. F. Whiting as Supt.—At the Odin gravel mine, near Nevada City, the shaft is down nearly 500 feet.

Riverside.

The Mgr. of the Good Hope mine, near Perris, has leased portions of the mine to different people, who are working with good results. The cyanide works at the Good Hope and also at the Santa Rosa are in steady operation and good results are obtained.

Riverside Enterprise: The strike made in the Gavilan mine, near Riverside, is proving of a substantial character.

San Bernardino.

The Rose Cyanide Co. sold to the Rose G. M. & M. Co., for \$3500, the cyanide plant in the Morongo mining district.

Free Press: The Index M. Co. is making arrangements to work the Iron Mask, One Horn and Index mines, near San Bernardino.

San Diego.

The Ranchita mine, near San Diego, is working three shifts a day, and the 5-stamp mill is running twelve hours a day. The shaft is down 430 feet.

The San Diego Union says that a smelter for gold, silver and copper ores is about to be established near San Diego of twenty tons capacity. It will be running Jan. 1st.

Shasta.

Morrissey Bros. sold to A. Hurst a half interest in the Mabel V mine, in Harrison Gulch mining district.—A one-third interest in the Rainbow mine, near Shasta, has been sold to J. Stevens of McCook, Nebraska.—The National mine, near Redding, has started its 10-stamp mill.—T. J. Baker has sold a half interest in the Smoky mining claim, near Redding, to B. Ballinger.

Sierra.

At the Plumbago mine, near Alleghany, next Monday the air compressor plant that is to run the mill, hoist, pumps and drills will be started.

Downville Messenger: I. Copeland is pushing work at the Gold Bluff mine, near Downville, with thirty men. Repairing the ditch and flume was finished last week; men are snowshedding tracks and making other improvements for winter. More than 50,000 pounds of freight has been received within two weeks. There are still 7000 pounds to arrive. A second new air compressor was received last week. Mgr. Copeland will soon put in a second pump. The mill is running full capacity, twenty stamps.

Siskiyou.

The Commodore mine at Barkhouse Creek is paying well. The ledge is 4½ feet wide.—The Hollister Co., working the old Spencer mine on Humburg, is running a tunnel to tap the ledge at depth.

Yreka News: The tunnel run by Ironside

& Wadsworth on the Little Wonder is in 150 feet, showing good value. This tunnel at 500 feet will cut the ore bodies 800 feet deep.

Yreka Journal: The New Pinery Co. are working drift diggings in Quartz valley with success.—Good ore has been struck in the Golden Eagle mine at Indian creek.—McCaw & Co. have a large body of ore in their mine at Patterson creek.—San Francisco men will operate the Summerville or Red Hill hydraulic mine on Salmon river.—The American Bar mine near Hornbrook is worked with a large force.—Hunter & Co. of the Cherry Hill mine, near Yreka, have found a ledge 7 feet wide in the new lower level, 2 feet of which is high grade. They are getting out a quantity for crushing in the 10-stamp mill of Fry & Macaulay, in which the Cherry Hill Co. owns an interest.—Ironside & Wadsworth have quartz at Cherry creek, which prospects gold, galena and iron.—The Greenhorn Blue Gravel Co. continues work day and night, with water pumped from bedrock.—The Oro Fino Hydraulic Co., near Fort Jones, has four elevators ready to start as soon as they get water.—Morrison, Carlock & Co. have put up machinery at their mine in Quartz valley, and started operations this week.—The company running a tunnel through Humburg mountain, near Yreka, has suspended work until next spring. The tunnel is in 600 feet.—The Yreka M. & M. Co., operating the old Gold Ball mine at Salmon river, has a large force at work since last September getting out quartz.—About \$200,000 has been invested in Scott valley this season for mining property. The Oro Fino mines of Eastlick Bros. and Wright & Co. were sold to a San Francisco company for \$57,000; Brokaw & Co. bought mining ground in Quartz valley for \$35,000; the Sheba Co. bought the Fry & Macaulay quartz mine on Patterson creek for \$35,000; the Gray Eagle Co. recently bonded a property for \$50,000 in Quartz valley; a New York company bought the Golden Eagle mine at Indian creek for \$35,000.

Yreka Reporter: W. Klein of Sawyer's Bar will work the Casey mine in Eddy's gulch the coming season.—The old Morning Star mine in the Salmon country will, it is said, be started in the spring by a new company. The property has been idle a long time.

Trinity.

The Golden Jubilee Co. near Trinity Center are prepared for winter work. The mill runs when there is sufficient water. The main body of the ledge carries \$5 in free gold and high-grade sulphurets.—W. A. Wagner is doing development work on his mine and is ready to build a mill.—Rubling & Co. have developed a lode of free milling ore near Trinity Center. They have an arrastra and crushing.—The Strode mill at Carrville has been shut down for the winter.—McDonald Bros. & Co., who bought the Bloss & McClary placer mine at Trinity Center, are getting into shape for the season's work. They have enlarged the upper ditch, doubling its capacity, built flumes and laid new pipe. They are preparing to put in an electric plant.

The Mountain Boomer mine, near New River, which was supposed to have been worked out, is operated by a San Francisco company, who are well satisfied with their speculation. The old works have been reopened at a depth of 240 feet with an upper tunnel, where a 30-inch ledge has been uncovered which runs \$40 in gold to the ton. A second tunnel is being run 650 feet below the old one.

Shasta Courier: J. Early and partner, who have been leasing at the Brown Bear mine, Deadwood, have taken out about ninety tons of \$37 rock. Leasers at the mine do well. The new tunnel is in 150 feet. Its length will be 4200 feet, and it will cut several ledges. A new steam engine will drive the power drills. The old mill will be retained for leasers, and, if the tunnel justifies, a new mill will be erected. J. Melton of Placerville, Cal., and C. Watt of San Francisco are the principal owners.

Weaverville Journal: The Altona Quicksilver M. Co. at Cinnabar are working steadily with seventy men. Work will continue through the winter.—At the Integral mine twelve men are employed. The tunnel is in about 200 feet. In crosscutting for the vein of cinnabar Supt. Laws struck an ore body of gold-bearing quartz 50 feet wide averaging about \$4 a ton.—The Nash deep gravel mine at Abrams has been fitted up and is ready to be run as soon as water comes.—At the Frue & Norton mine a tunnel is being run by contract.—Hill & Lorenz have closed down for the winter their tellurium mine. The mine is situated on Union creek, a branch of Coffee creek, and carries very rich tellurium ore. Just before closing down ore was taken out going as high as \$2000 a ton. The ore is packed from the mine and shipped for reduction.

Tuolumne.

F. Sutton has bonded the Street mine at Tuttle town to F. L. Wooster of San Francisco.—Work will be commenced at once. In the Hazel Dell mine a strong body of ore has been found.—The shaft on the Excelsior has been driven 140 feet.—The new canvas plant at the Confidence has been completed.

Jamestown Magnet: The Confidence mine at Confidence is in active operation, a 20-stamp mill running night and day.—The Buchanan is being reopened under the management of Supt. Moorehead. A tunnel will be run to the shaft, which is filled with water, tapping it at the lower levels.—The Dreissam mine is a small but rich vein; it has six stamps in operation.—At the Hard Times mine development is in progress and a 5 stamp mill is in operation.—At the Excelsior mine, near Sugar Pine, sinking is carried on. When a depth of 300 feet is reached, drifting will begin.—J. Ryan is reopening the Old Gold mine.—Work at the Bown mine, Tuttle town, is progressing. Since last February the shaft has been sunk 480 feet, four stations put in and 1200 feet of drifts run.—At the Uncle Sam mine sinking is in progress.—C. G. Bacon

and associates have begun work on the Cenell ranch, near Columbia. At the Gray Eagle mine a Gates canvass plant will shortly be put in. Peabody & Ogden have discovered a vein 4 feet wide near Columbia that prospects well. The Tuolumne County Water Co. will soon extend their electric line to the mines along the mother lode.

Sonora Independent: The Moody mine and mill at Big Oak Flat are working steadily. It is locally reported that Mr. Moody will put in a 20-stamp mill soon. The Longfellow has put in a new hoist, and it is thought the mill will soon start. The Nonpareil is yielding a good product. J. Hardin made a good strike on his claim near Big Oak. T. Sorrenson is working successfully on the Gold Bug.

COLORADO.

BOULDER COUNTY.

Culberson Bros., who secured a lease on the Antietam and Independent properties near Eldora have begun operations. A chlorination mill is being built of fifty tons capacity at a cost of \$80,000, to treat the ore from this mine. The vein is 15 feet wide and averages from \$15 to \$22 per ton in gold.

Boulder News: The Delano mill at Boulder is treating thirty-five tons a day. Of this amount fifteen tons is taken from the Kiklonga, the company's own mine; the Ingram furnishes five, the Teagarden five, the Logan two and a half and the remainder from miscellaneous sources. The company buys the ore, deducting \$9 per ton and 5 per cent off for treatment.

CLARK COUNTY.

Idaho Springs News: J. Owen sold the Gum Tree property near Idaho Springs to New York capitalists for \$57,000.

Idaho Springs Gazette: Near Silver Plume the Smuggler mine is producing ore running \$19 in gold and heavily in silver, with a good percentage of lead. C. Hanson had a mill run recently from the old Corry City that returned \$390 per ton. Other leasers are also coming into good ore in this property. The Stevens mine has twenty-two leasers. They are all in ore, which runs from 60 to 70 per cent lead, from twenty to thirty ounces silver and from \$2 to \$10 in gold. The Seven-Thirty, Pelican-Dives, Bismarck, Eagle Bird, Zephyr and Illinois mines are all being worked under the Pelican-Dives Co., and most of them are producing good grade of ore. The bulk of the ore is being taken out of the Bismarck, Pelican-Dives and Seven-Thirty.

At Georgetown the Kirtley has several sets of leasers working. The ore from this property runs 500 ounces silver per ton.

The Aliunde and Colorado Central mines, owned by the Aliunde Co., are producing good ore. A strike recently in the Aliunde shows a streak of 6 inches to 1 foot of high-grade ore. W. Moore has leased his Empire City lode at Empire to a company who will sink the shaft 1000 feet.

CUSTER COUNTY.

Veins of nickel ore of good quality are said to be found in the Gem mine, near Silver Cliff, which run 45 to 64 per cent nickel to the ton, and it is associated with copper.

DOUGLAS COUNTY.

Castle Rock Journal: The Grant mine at West Creek will shortly reopen with H. D. Bell as Mgr. The property has come into possession of Pennsylvania people who expect to push work.

EAGLE COUNTY.

The May Queen Leasing Co. made a fifty-ton shipment of low-grade ore.

EL PASO COUNTY.

The total tonnage for the output of ore from the Cripple Creek district for November amounted to 36,450 tons, with a valuation of \$1,447,500. An estimate on the production of the Legal Tender mine at Victor for November places the tonnage at 2700 tons. The royalties paid by lessees on the Fluorine on Copper mountain to the Montreal Co. are \$945.24. Of this amount \$750 will be shortly paid out in dividends. The Victor mine is outputting eighty tons daily. The Gold Coin ships 700 tons of ore every week. The Birch lease on Mary McKinney ground last month output \$30,000. The Creston lease on the Jack Pot is outputting forty tons every twenty-four hours. The average value of the ore is \$60 a ton.

Victor Record: Twenty tons of ore was shipped to Denver recently from the Zenobia at Victor, ten tons of which is of about 7½ ounce grade, seven tons will return values of 15 ounces or thereabouts, while about three tons of high-grade mineral will, it is believed, prove to be worth about \$1 a pound. The settlement check will not be much short of \$10,000. A fifty-ton shipment of two-ounce ore was sent out last week by Langstaff & Co. from the Pueblo. The Vindicator Co.'s workings shipped about 1500 tons and lessees a like amount in November. The Legal Tender output for November ran near 3000 tons. The production from the Modoc mine last month is reported to be fifty-five cars of second-grade and a few of high-grade smelting ore. The first shipment of twenty tons from the Saunders lease on the Silver Tip yielded ten tons at \$191.60 per ton and ten tons at \$56 per ton. At Cripple Creek, in the Gold Sovereign mine, all but two of the lessees are working in good ore; they paid the company \$2000 in royalties last month. Of the shipments, 235 tons averaged \$55 per ton and there were 70 tons left in the bins of last month's output. One carload was \$160 ore.

GILPIN COUNTY.

A gold retort weighing eighty-seven ounces was the result of a cleanup on mill ore from the Pierce mine at Black Hawk. The Gelfer mine in Pine district, owned by M. Stefan of St. Louis, continues to be the leading producer of that district. A portion of the ore is treated under stamps. The rest of it is concentrated at Black Hawk.

GUNNISON COUNTY.

Marble Times: The first carload of Black

Queen ore was shipped from Marble last week. Five carloads are ready to be hauled out. The ore is shipped to Denver.

HINSDALE COUNTY.

Lake City Times: The returns from 16,100 pounds of ore shipped from the Wyoming mine near Lake City amounted to \$1355 net.

LAKE COUNTY.

It is reported in Leadville that the Johnny mine has made a contract with the Rio Grande Railway, a branch of which has been extended to Breese hill, to ship 500 tons of ore per day. Neill & Co., owners of the placer property at Hayden's, have transferred their interest to the Columbine Hydraulic M. Co., who contemplate washing considerable ground next spring.

The Small Hopes M. Co., operators of the 1400-foot R. A. M. shaft, at Leadville, are hoisting on an average 300 cars every twenty-four hours, each car containing 3000 pounds. The bond on the Ballard mines, on Breese hill, was taken up last week. It was for \$10,000. The Big Six property, at Leadville, was leased last week to A. L. Englebaugh, who will at once put on a plant of machinery and sink a shaft 500 feet deep.

LA PLATA COUNTY.

It is locally reported that the Sundown mine and mill, on East Mancos, was sold recently for \$60,000, \$20,000 of which was paid down.

MINERAL COUNTY.

The Commodore and Sunnyside group of claims, at Creede, make daily shipments to the Bimetallic works here. The output of these mines averages 300 tons daily. The dividends declared so far have amounted to \$432,000.

Creede Candle: At Creede the ore output of 1898 shows an increase over 1897 of 55 per cent.

PITKIN COUNTY.

The new mill at Aspen, built to treat the low-grade zinc ore of the Smuggler mine, which runs about ten ounces silver, 10 per cent lead and 25 per cent carbonate of zinc, treats 100 tons every twenty-four hours, with only seven men employed on both shifts. After the ore passes through the big crusher three Chilean mills pulverize it to sufficient fineness for the twelve zinc tables. Ten tons a day is the product that this mill produces; it will run 65 per cent lead and forty to forty-ounces in silver and brings about \$500. The old Smuggler concentrating mill is daily using up 140 tons of ore, running one 11-hour shift, and producing about twenty tons of concentrates per day.

ROUTT COUNTY.

The Tom Thumb mine near Columbine will make shipments of their best ore all winter and hold the lower grades at the mine.

SAN JUAN COUNTY.

The Tom Moore mine at Silverton is a steady shipper of lead ore, aggregating two carloads a week.

SAN MIGUEL COUNTY.

Near Telluride fifty men are working in the Carribean and Montezuma mines, owned by the C. & M. M. Co. Most of them are leasing, but some of them are doing contract work. The product, with the exception of the high grade, is concentrated at the company's 10-stamp plant, and from three to four carloads of concentrates are turned out weekly. The concentrates net as high as \$1200 per carload. A force is at work erecting a wire rope tramway 2400 feet long between the Euclid Avenue mines and the Hogg stamp mill. The Colorado Expl. Co., E. W. Waybright, Pres., secured control of this group of mines and mill, and is getting them in operation as soon as possible. The mill will be overhauled and 850-pound stamps substituted. The Euclid vein is from 4 to 6 feet wide and runs from \$20 to \$30 per ton. J. K. McCoy, lessee of the Gold King mine near Telluride, is taking out enough ore to supply twenty stamps of the Gold King 40-stamp mill. The Gold King carries from 4 to 10 feet of ore that is free milling. It is said that \$3.50 ore from this mine will yield a small margin, due partly to the ore being free milling and easily mined and to cheap power. The mill, hoist and all other machinery are operated by electric power. F. F. Horton, lessee of the Silver King, are developing and backing out stoping ground. Their ore runs about \$500 to \$600 per car in silver and lead and a small value in gold. The Carribean mine at Ophir is turning out ore bearing high silver values, with a fair percentage of gold. The snow sheds have been rebuilt over the tramway and everything is in readiness for winter work. On the Wasatch mine near Telluride White & Co. will push development throughout the winter. The Wasatch carries 2 feet of ore, which yields \$20 per ton in gold. The ore will be stored until spring.

IDAHO.

It is locally reported that a good strike was made in the 600-foot level of the Lucky Boy mine at Custer last week. The ore body is said to be 4 feet wide and is of high grade.

The Fortune mine in Buffalo-Hump camp has been sold to Spokane people for \$25,000. Near Wallace in the Colwyn mine the tunnel is in 450 feet. Another tunnel will be run before spring opens. The new hoist for the Standard M. Co. will work to a depth of 2500 feet. Near Wardner the Lexington is producing some galena. At Mullan the You Like mine will again commence shipping ore to the concentrator.

Idaho City World: At Grime's Pass new discoveries are being developed. Aside from the new discoveries in the Morning Star Co., ore is cut by a tunnel 2200 feet long. The Twin Springs M. Co., which recently bought the Deer Lodge mines for \$100,000, of which \$15,000 was paid down, contemplates erecting soon a 40-stamp mill. In the Gould mine at Hailey an upraise to the surface, a distance of 700 feet, has begun. The Tip Top, owned by J. Q. Packard of Salt Lake City, is being

equipped with a large plant of machinery and a mill.

MICHIGAN.

The eight producing copper mines in Houghton county, are Calumet & Hecla, Quincy, Osceola, Tamarack, Wolverine, Centennial, Franklin and Atlantic. The total dividend disbursements amount to \$73,732,000, with the present rate of distribution about \$5,500,000 per annum. At Houghton, a carload of machinery, including a hoist and compressor for the Union copper mine, arrived last week, and the shaft has been begun on what is believed to be the Arcadian lode. Machinery for the shaft started on the Kearsarge lode at the Centennial is on the ground, including a small compressor for sinking. New machinery for the Adventure will be shipped soon. The shaft at the Tecumseh reached bedrock at a depth of 101 feet.

MONTANA.

E. L. Whitmore & Co. of Butte have taken a lease on the Martha W. mine and adjoining claims near the old H. & H. mine at Winston. They propose to equip the property with machinery and push development. In the Madisonian 6 feet of ore has been uncovered that shows from \$10 to \$142 in gold per ton. Sixty bars of silver bullion, with an aggregate value of \$80,000, were shipped by the Anaconda Copper M. Co. last week. At Libby at the Snowshoe mine the mill has been shut down owing to a scarcity of water. Power drills are being placed in the mine. At Carbonado shipments have begun of coal from the Daly mine. The output will be increased, and it is thought the mine will be one of the heavy producers of the State.

In the Hope mine, at Basin, they are cutting a station and putting in a pump at the 500. They will sink to the 600. If the ore body at that depth is half as good as at the 500, the company will begin work on a 500-ton concentrator, which they expect to have in operation by July. At the Emery mine, near Deer Lodge, ore shipments were resumed last week. The Baltimore mine, near Boulder, has begun shipping ore. The Montana Reduction Co. owns an extensive group of mines and a large mill at Red Butte. A dry amalgam mill had a successful run the past summer and fall, but closed down last week, owing to the water having frozen. The mill has been running for a year on ore from the Bessie. At the same time development has been carried on in the Golconda, which is in 900 feet and in which men are crosscutting. The Monitor group of mines near Butte have been put into a new company under the name of the Monitor Tunnel Co., and will again be worked. The group consists of the Emporium, Alta, Sunlight, Monitor, Fraction, New Oterald and Burner.

NEVADA.

A strike of ore has been made at the Elira near Tuscarora on the 200 level. The new vein is about 3 feet in width and assays high in gold and silver. The company has bought the old Commonwealth hoisting works and machinery, and are removing it to the Elira ground. The shaft will be enlarged to two and a half compartments. Work will begin immediately. The Navajo mill is running on Elira ores and a shipment of fifteen tons of concentrates will be made soon, in addition to five tons of high-grade ore. M. Schri is preparing to ship antimonial ore from Battle Mountain. The Black Eagle of Siegel valley, White Pine county, made a shipment of ore to Salt Lake City showing seventy-five ounces silver and 36 per cent manganese. The Black Eagle is the property of Siegel & Davis. In the same camp the Gold Crown also made a shipment of ore. The ore body is 2 feet and the product silver.

Campbell & Lund are pushing work on the Horseshoe mine at Deer Lodge, and eight men are running drifts from the bottom of a 100-foot shaft. They have a 3-foot vein of fair grade ore. At Como the new mill is running steadily. The percentage of the assay value of ore leaves a fair margin. The water supply is inadequate to run the mill to its full capacity. It is expected that work will be resumed on the Como-Eureka and North Rapidan next spring.

Virginia Chronicle: The Pumping Association on the Comstock is giving employment to a number of men at the C. & C. shaft and in the Sutro tunnel, and miners have been given concessions to prospect the surface workings of the Mexican and Ophir. It is denied that the Dexter M. Co. at Tuscarora has secured an option for a controlling interest in the Young American East mine.

NEW MEXICO.

At the Cochiti mine, near Bland, the shaft is down to the fourth level. The mill crushing is almost satisfactory, causing some delay. They expect to crush 3000 tons in December.

Santa Fe New Mexican: The Legal Tender mine at Silver City is shipping a car of ore per day to the smelter. In 364 days the Pacific mill of Pinos Altos has made 18,837 tons of concentrated tailings, and shipped to the Silver City reduction works 5770 tons of concentrates and slimes valued at \$89,299. The Pinos Altos G. M. Co. has 100 men mining and timbering. Near Hillsboro, the Golden Era group of mines will shortly begin shipments of ore. The Andrews cyanide mill is treating thirty tons of Tripple mine ore per day. The Indiana mine, near Elizabethtown, has \$20 free gold ore. The vein is from 18 to 30 inches wide. The output of the Hillsboro gold mines for the week ending Nov. 24, was 360 tons.

OREGON.

Near Baker City the May Queen will build a 20-stamp mill in the spring.

Near Cornucopia there are in development over fifty claims, the ore assaying from \$4 to \$70 per ton in gold and silver.

Near Grant's Pass, the Browning Bros. have made another discovery, which shows well.

Harmon & Green of Galice creek have been operating their mine two weeks. They have enough water for a full head through a 6-inch nozzle.

Grant's Pass Journal: Grater & Brown bought 180 acres in the Klamath river section and will equip it for mining on an extensive scale. The Sterling M. Co. has finished its clean-up for 1898, which was good, and is making preparations for next season's run.

Jacksonville Times: Senator Jones & Co., who are operating on a large scale in Mt. Reuben district, have applied for patents to several quartz claims. J. Young of Waldo, who has been developing a copper prospect in Preston Peak district for several years, has sold it to W. Grider of San Francisco, who represents a company. A force will be put to work on the property at once.

SOUTH DAKOTA.

The Keystone mill, Deadwood, started ten of its new stamps last week. The other ten will be started soon, and the output of the consolidated Holy Terror and Keystone mines will be doubled.

UTAH.

The Horn Silver, Frisco, shipped four cars of high-grade concentrates last week. The Hercules of Stockton shipped two cars of high-grade silver and lead ore. The Utah of Fish Springs marketed a carload of ore last week that showed 42 per cent lead and 273 ounces silver per ton. The Swansea at Silver City has three new drills installed. With this plant the Swansea will make from 130 to 150 feet per month in a class of rock in which they have been making but 4 to 7 feet a week. The work of putting the shaft another 100 feet, making a total of 850 feet, will begin at once.

Operations at the Sioux mill, Robinson, will not be resumed until after Jan. 1st. Ore, however, is being hauled to the mill continuously, and by the time it is started there will be sufficient ore to keep it running for some time. The Taylor group of claims at Frisco made a trial shipment of high-grade galena. A trial shipment was made from the Solomon group near Frisco, in which some high-grade copper ore has been uncovered.

The Parnell and nine other mining claims near Bingham were sold last week to Boston people for \$100,000, and development work has begun. The property is supposed to be principally copper. In the Confidence mine, near State Line, the shaft is 160 feet deep, and 3 feet of high-grade gold-bearing ore is exposed.

The La Reine at Eureka has installed an air compressor and power drills. In the Jo Bowers Extension, at Diamond, the company has 6 feet of milling ore; a set of jiggers will be introduced soon. The shaft is down 300 feet. The tunnel on the Yankee at Eureka is in over 800 feet, and is mineralized matter. At Diamond, Walker Bros. are arranging to begin work on the Showers group.

Last week's shipments of ore from Park City were:

| | Pounds. |
|--------------------------|---------|
| Silver King..... | 840,150 |
| Anchor concentrates..... | 253,630 |
| Ontario..... | 200,810 |

Total.....1,294,490

Last week Cincinnati, Ohio, people bought 37,500 shares of Linn Mammoth of Tintic for \$3 spot, a total of \$262,500. The purchasers are said to be ready to take the remainder—consisting of 62,500 shares—at the same figure. The Mercur M. Co.'s new incline into Resolute ground has broken into ores of good milling value. Bingham's new strike was made last week in the Frisco, showing thirty-two ounces silver, 32 per cent lead and \$3 gold per ton. A telephone message from Mercur recently brought assurances that in the South Daisy, Mercur, a strike was made assaying from \$9 to \$15 per ton in gold. A shipment of 225 tons of Old Telegraph concentrates was made from the Dewey mill at Bingham last week. The contract to deliver 2000 tons of Old Telegraph second class will be completed this week. Last week's shipments from Tintic were 102 cars of ore and 8 cars of concentrates. The Colorado at Tintic has uncovered mineral that shows \$5 in gold and twenty ounces silver per ton. At Eureka the Eagle and Blue Bell are sacking ore, some of which shows 526 ounces gold per ton, running in small streaks of the ore body. The Albion at Alta made its initial shipment last week.

WASHINGTON.

(Special Correspondence).—Since my last communication a great change has taken place in Republic. Town sites have been patented, and people have moved from their tent abodes into comfortable frame dwellings; store buildings have been improved, and somewhat pretentious hotels are marking the tide of prosperity which has followed the advent of the Republic mine on a dividend-paying basis. The progress of mining development is very satisfactory, and a general feeling pervades the community that a few months hence there will be others on the dividend list.

The Republic G. M. & M. Co. has declared its third monthly dividend, payable Dec. 10th. The mill has been shut down, pending the completion of improvements. An engine and boilers, two storage and six electro-cyanide vats and an extra ball pulverizer have been set up, and the mill is again ready to run on second-class ore. The company will continue to ship its first-class ore to the smelters. The mill has been treating 300 tons per month of second-class ore and for six weeks produced \$100 per day. It is officially stated that it will treat from thirty-five to forty tons per day during the winter.

The No. 3 tunnel has passed into the Republic pay chute, 200 feet of vertical depth below the No. 2 level, disclosing the vein 34 feet wide between the walls. Drifts are being run north and south on the lode with all possible speed, and, while visitors were generally admitted and retarded work to a great extent, all are now excluded, in order that no delay may be occasioned in drifting and making connections with the upper levels. The

assays on the No. 8 level run from \$15 to \$310 per ton, and the average will run about \$160 gold and six ounces silver per ton.

A change of management has taken place in the Lone Pine mine, Patrick Clark succeeding Charles P. Robbins as Pres. One ledge has been crosscut 15 feet, giving values from \$8 to \$40, but the mine has been idle several months. A force of twenty men have been put on and it will be actively developed.

The Tom Thumb mine shows a fine ledge. A shaft was sunk and passed through it 95 feet into the porphyry foot wall. A crosscut was also driven, which showed the ledge 25 feet wide, with face samples running as high as \$12 per ton. A new shaft is down 78 feet and is expected to tap the lode at 125 feet depth.

The north drift of the San Poll mine is in 51 feet, and the face, the full width, is in pay ore. The south drift is in 79 feet and the ledge is improving. It had shown a pinching tendency, but has a width of 21 inches at this point, with values running over \$15 per ton.

The crosscut from the tunnel in the Nob Hill mine is in 129 feet in hard porphyry.

The Ben Hur tunnel is in 138 feet to the vein and runs on about 140 feet. It is divided by the intrusion of porphyry into separate bodies, but shows improvement at the face.

The Little Cove mine is developing satisfactorily. The north drift is in 326 feet. At 300 feet a crosscut passed through 10 feet of quartz, but the average value was not as good as usual, running below \$11 per ton.

The Gold Leaf tunnel is in 260 feet, and confidence is expressed that the ledge will soon be cut.

The management of the Iron Monitor mine has passed into new hands, and a contract has been let to continue the tunnel to the west vein. It has about 80 feet farther to run.

The main tunnel on the Eureka Queen is again being driven ahead and drifting has been stopped for the present.

The Golden Harvest tunnel has run into a pay chute which gives assays from \$11 to \$45. The ledge is about 5 feet wide.

The Trade Dollar tunnel shows a strong ledge over 6 feet wide which assays about \$10 per ton. The mine was recently stocked and capital for development readily subscribed.

The North San Poll M. Co. was recently formed to work the San Poll Fraction, a claim about 800 feet long, on the north end of the San Poll mine. The vein shows a strong 6-foot ledge of quartz at the surface. A well-timbered shaft is down on it 20 feet. The values average about \$10 per ton.

The No. 1 tunnel is in 107 feet, with about 100 feet farther to run to tap the vein. This is being driven for the development of the Alkadar group.

M. H. JOSEPH.
Republic, Wash., Dec. 1st, '98.

Near Bossburg work has resumed on the Scotia properties. The company has nine claims. The development consists of a tunnel 260 feet long. Considerable ore has been developed of shipping quality.—Near Republic the Lake View claim has 18 inches of ore

that assays from \$12 to \$60 per ton. The rock is free milling. One of the owners started for San Francisco this week to buy a mill.—On Mad river in Okauchog county, near Leavenworth, a ledge of platinum is reported found which is said to run seventy-two ounces to the ton.—The Gold Leaf tunnel at Republic is in 260 feet and will be extended 75 feet.—The Golden Harvest has 4 feet of quartz.

WYOMING.

At Grand Encampment there are two mines that will ship steadily. One of them runs from 45 to 50 per cent in copper and \$17 in gold, and the vein is 10 feet wide.

FOREIGN.

BRITISH COLUMBIA.

The change in the management of the Le Rol resulted in a reduction of the shipments from the old standard of 3000 tons to a trifle over a third of that quantity—1100 tons. The output of Rossland camp the past week reached 3500 tons. The shipments from the War Eagle were increased to 2300 tons, while the Iron Mask's total product was 100 tons. The shipments for the past year show an increase. The ore shipments from the mines adjacent to Rossland from Jan. 1st to Nov. 26th were 116,171 tons. The shipments from Nov. 19th to Nov. 26th were 3500 tons.

LOWER CALIFORNIA.

(Special Correspondence)—The Fortuna M. Co., a New York corporation, have for some time been operating the property of the same name near Agua Dulce. Alleged mismanagement of the superintendent got the company into difficulty and the property was seized by the Mexican government. The mines are considered valuable property under capable management. They have been examined recently for the company and it is probable that difficulties will be adjusted and work resumed. It is thought that H. Howard of Los Angeles will be Gen. Mgr. of the property if operations are renewed.

Agua Dulce, Nov. 28th, '98.

A good strike is reported from the mines of the Ibarra G. M. Co. at Calmali at a depth of 600 feet. The owners are San Francisco men. They have ordered additional machinery from that city, which is en route to the mines.

MEXICO.

Nogales Vidette: The Guadalupe mine in the Sahuaripa district, Sonora, has been bonded by Denver capitalists.—A new shaft is being sunk in La Mexicana mine, in the Arizpe district. This property is owned by Newport, Kentucky, capitalists.—From Guaymas last week were shipped to the mint at Culiacan, Sinaloa, twenty-eight bars of silver bullion valued at \$23,000.

SOUTH AFRICA.

The gold output of the Witwatersrand mines in October was 328,648 ounces, worth \$6,793,154. The whole Transvaal produced in ten months of 1898, 3,054,671 ounces, worth \$62,726,649.

"Dearborn Saccharated Tannins"

Instead of "SODA MIXTURES"

Clean Boilers without that awful corrosive action.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade-mark.

Our German drawing instruments bear only the trade marks  or . We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade cited. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Baragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done FIFTY PER CENT Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

The Mait Dry Gold Saver.

The only thoroughly practical Dry Washer ever invented. Will save a larger per cent of gold than any other machine. Is CHEAP, LIGHT and DURABLE. Has a better riffle board and action than other machines. Has taken first premium over a dozen competitors. Made in three sizes—small, medium and large.

WRITE FOR COMPLETE INFORMATION AND PRICES AT ONCE.

THE
BRYAN
ROLLER
QUARTZ
MILL.

Is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post.

SEND FOR
CATALOGUE NO. 8.

THE BRYAN ROLLER QUARTZ MILL

We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. Strong. Economical. Simple.

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1898.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, **J. P. WOODBURY, Supt.**

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 8, 1898.

SILVER.—London, 27 3/4; New York, 59 3/4; San Francisco, 59 3/4; Mexican Dollars, 47 1/2 @ 47 3/4. New York exchange, sight, 15; telegraphic, 17 1/2 cents premium.

LEAD.—New York dispatch, very dull, \$3 60 bid, \$3 62 1/2 asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead \$3.50.

Local, pipe, 6 @ 6 1/4 c; sheet, 6 1/2 @ 7 c; pig, 5 3/4 c; bar, 6 c.

COPPER.—New York reports Lake quiet, 12.65 bid, 12.80 asked. Local, bar 20c per lb.

IRON.—American, soft, \$21.75 and \$23.75 per ton; Scotch, \$24.25. Local bar, 2 1/4 c per lb.

SPELTER.—8 1/2 @ 9.

TIN.—Pig, 22c per lb.; Bar, 25c.

ANTIMONY.—14.

BABBITT METAL.—No. 3, 7c.

QUICKSILVER.—Unchanged. Local, \$42; export, \$37.00 @ 37.50; carload lots, special rates.

Messrs. D. Houston & Co., metal brokers, New York: European copper consumption continues at a strikingly high rate, and deliveries are heavy in volume, exceeding supplies for the first 11 months of this year by 5037 tons for all Europe. Deliveries for 11 months this year amount to 213,270 tons, and supplies to 208,233 tons. The movement of copper in Germany is of a marked character, and that country is taking a more prominent place among the chief consumers of copper. Official returns show that Germany has used on an average 1552 tons more of foreign copper per month for the first nine months of this year than during the same period in 1896. German consumption of copper for this year, including foreign and domestic metal, is estimated at the rate of fully 17,500,000 pounds per month. The combined consumption of England and France for the first ten months of this year is estimated at 208,465,600 pounds, or at the rate of 20,846,560 pounds a month. As long as Europe needs and is able to so completely absorb such enormous quantities of copper there seems to be little or no danger of any radical reaction in the market. It is a noteworthy fact that European copper production for the first ten months of this year is 4165 tons less than during the corresponding months last year, and is also the smallest in five years.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2 c; less than one ton, 17 1/2 c. No. 1* 60%, carload lots, 18 1/2 c; less than one ton, 15 1/2 c. No. 1** 50%, carload lots, 11 1/2 c; less than one ton, 13 1/2 c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9 1/2 c; less than one ton, 11 1/2 c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—8x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$8.

COAL.—San Francisco coast, yard prices: Wellington, \$8 00; Coos Bay, \$5 00; Seattle, 6 00; Southfield, 7 50. Cargo lots, Eastern and foreign: Wallaseed, \$7 50; Cumberland, \$9 00; Rybmo, 7 50; Cannel, 9 50; Pennsylvania, hd., 14 50; Welsh Anthracite, 12 50; Scotch, 8 00; Rock Springs, 7 60.

COKE.—Foreign, \$13; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.08 per gal.; bbl., \$1.03; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.06; less than 200 gals., \$1.10; in bbls., 4c per gal. less than case; Baker's Crystal, \$1.26; China Nut, 52c; Linseed, strictly pure, boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c; lots of 5 bbls., 1c less.

MINES or prospects operated on contract to purchase, MONTHLY or under lease on fixed royalty or percentage. Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, Sunny Hill, Shasta County, California; location of works, Sunny Hill, Shasta County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of November, 1898, an assessment (No. 16) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 24th day of December, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1898, an assessment (No. 16) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 30th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
J. P. HOLLING, Secretary.
Office—113 Crocker building, sixth floor, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1898, an assessment (No. 2) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 218 Jackson St., San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 17th day of December, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 17th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
J. MIDDLETON, Secretary.
Office—213 Jackson street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of December, 1898, an assessment (No. 23) of three (3c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.
Notice.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 3d day of October, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of August, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, room 57, 916 Market street, San Francisco, California, on FRIDAY, the 25th day of November, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.
GEO. W. FLEISSNER, Secretary.
Office—916 Market street, room 57, San Francisco, California.

POSTPONEMENT.
The day of sale of the above delinquent stock has been postponed to MONDAY, December 5th, 1898, at the same place, at 10 o'clock A. M. By order of the Board of Directors.
GEO. W. FLEISSNER, Secretary.
Office—916 Market street, room 57, San Francisco, California.

DELINQUENT SALE NOTICE.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Riverside County, California.
Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 14th day of May, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|----------------------------|-----------|-------------|----------|
| W. H. Bailey, Trustee..... | 261 | 2,400 | \$240 00 |
| W. H. Bailey, Trustee..... | 261 | 2,000 | 200 00 |
| W. H. Bailey, Trustee..... | 262 | 10,000 | 150 00 |
| C. A. Bailey..... | 133 | 1,000 | 15 00 |
| C. A. Bailey..... | 135 | 1,000 | 15 00 |

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it."

For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

Northern and Southern California Gold Mines.

That part of the Pacific coast known as "California" comprises such a vast extent of territory that even to many residents it is difficult to realize that from its northern to its southern boundary is a dis-

DRIFT AND STOPE, 321-FOOT LEVEL, LITTLE BUTTE MINE, RANDSBURG, CAL.

tance of nine hundred miles over ordinary lines of travel. Illustrative of the extent of the gold area of

LITTLE BUTTE MINE, RANDSBURG, CAL.

miles apart, the one in the edge of what is known as "southern California," the others amid the snows of Shasta. It is not to be understood that the counties of Kern and Shasta mark the termini of California's gold-producing area. Two hundred miles farther south than Randsburg, Kern Co., is the largest aggregation of stamps under one roof in the State—200 in number—monthly pounding out \$50,000 in gold, and far to the north of Shasta stretches the great area of Siskiyou, gold-ribbed and still largely productive after forty years steady output.

In April, 1897, Clark, Allen and Oakley bonded a claim known as the Little Butte, at Randsburg, and organized the Little Butte Mining & Milling Co. At that time there was one shaft 107 feet deep following the hanging wall of the ledge, but with no pay ore down to that depth. The new company put in a horse whim and continued the old shaft down to a depth of 260 feet, at which point a small body of rich ore was found which continued 50 feet farther down in the shaft. The owners then bought a 25 H. P. gas engine and hoist with a capacity of sinking to a depth of 1000 feet. After

straightening up the old shaft to an even grade, they put in a T-rail track and a 1000-pound skip, erected necessary buildings for accommodating the machinery and began work of sinking and drifting every 50 feet east and west below the 260-foot level. This showed that the main shaft was sunk between two pay chutes, as drifting a short distance either way good ore was found. In April, 1898,

a two-stamp mill was bought to handle the ore taken out during development work, this little mill being run from the same engine that is used for hoisting, milling on an average about six tons daily. During the past four months there has been some stoping done from the 260, 321 and 378-foot levels, showing free-milling ore that yields well. At the 378 foot level was found a body of blue sulphuret ore that plates upwards of \$10, with \$3 to \$6 in concentrates. The main shaft is now down nearly 600 feet, with a width between the walls of from 12 to 15 feet, the ore holding good value. The company has on its payroll about thirty men, and during the month of November milled and shipped to the mill at Barstow about 300 tons of ore, all this going far to confirm the belief that, as elsewhere in the State, it pays to go down on southern California quartz developments.

On Rich Gulch, Shasta Co., is the National Consolidated, the northern outcropping of the Old Dig-

Patents for Pacific Coast Inventors; Notices of Recent Patents, 614.

gings quartz belt. At the Little Butte, in Randsburg, lack of water makes necessary the use of a gas engine for motive power. At the National Consolidated, water is utilized in producing electric current for light and power. As in the southern California mine, the Shasta property produces free gold, the arsenides and pyrites being concentrated, thirty miners finding constant employment. The ore body lies near the contact of the slates and plutonic rocks and is reached by a 700-foot tunnel.

In the same vicinity in Shasta Co. is the New Brunswick mine, here referred to as illustrative of how an "abandoned mine" under better management can be made pay. After the expenditure of considerable money the mine was abandoned, and laid idle many years. The present owners spent a little money judiciously, have put up a small stamp mill from the profits and are steadily going ahead.

The only reason for citing these small properties in each end of the State is to note that it is just in the way they are worked lies largely the development of the State's mineral wealth. What it is desired to point out in illustrating and referring to these small concerns is in such slow but sure ways—cautious, economical, intelligent and progressive work—may the mineral area of the State be made of greatest value.

We have many great mining enterprises made possible only by aggregation of individual capital, prominent because of their magnitude of output and admirably administered. It is only by such aggregation of capital and liberal investment that great mining properties are made. But nearly all things truly great have humble beginnings, and some of the greatest mining enterprises began as quietly as have those noted herein. The point, however, is here: A hundred small mines are better than two or three large concerns—better for the miner, the local market, the machinery manufacturer, the mining engineer, the furnishers of mining supplies and everybody indirectly connected with the industry. For, after all, it is on small mines so worked that the public prosperity rests, as their multiplicity means the creation of a mining class, individual owners and wage earners as independent in their way as the farmer or the merchant. Such development means the establishment of permanent mining communities, the creation of the most profitable kind of home markets, an increase of population and wealth and an aid to the general prosperity of the State.

In a similar way in other parts of the world the mining industry has been thus developed to the general good. In no other way can better wages be secured; in no other way can the money produced be kept to aid in further development of the State's industries, and in no other way can the working

miner be given opportunity for permanent and independent occupation. Sole employment of foreign capital, foreign drainage of profits and steady decrease in the wage scale will never build up a commonwealth. Foreign capital is not to be decried, but the greatest measure of value to this State or any other State is proportional to the earnings either for themselves or for others of abiding American citizens.

MEMORABLE in mining annals is the recent rise in the value of shares of stock in leading copper companies, the evidently profitable character of the business occasioning unusual demand, more especially in Boston and other Eastern cities, for the stock at a price far in advance of former figures. Investors figure about as follows:

| | Annual Production (approximate) pounds. | Cost laid down N. Y., cents per pound. | Present Mkt price cents per pound. | Profit per annum based on such calculation. |
|-------------------|---|--|------------------------------------|---|
| Calumet..... | 100,000,000 | 6½ | 13 | \$6,500,000 |
| Montana..... | 60,000,000 | 6½ | 13 | 3,900,000 |
| Tamarack..... | 20,000,000 | 9 | 13 | 800,000 |
| Quincy..... | 17,000,000 | 6½ | 13 | 1,105,000 |
| Old Dominion..... | 10,000,000 | 7 | 13 | 600,000 |
| Osceola..... | 10,000,000 | 8 | 13 | 480,000 |
| Atlantic..... | 5,200,000 | 9½ | 13 | 125,000 |
| Wolverine..... | 4,500,000 | 7½ | 13 | 236,250 |

The Boston *Financial News* points out that the above profits would be equivalent to a profit per share per annum of \$65 on each share of Calumet; \$26 on each share of Montana; \$13 on Tamarack; \$11 on Quincy; \$4 on Old Dominion; \$5.25 on Osceola; \$4.88 on Atlantic, and \$3.93 on Wolverine. On the assumption that the price does not go below 13 cents, and that the cost of production will not be exceeded the Boston estimate, it will readily be seen how the possession of such stock appeals to those who have money which they want to earn interest for them, and who view with indifference the state or municipal security that offers but 3% per annum.

THE technical report of G. W. Melville, chief of the Bureau of Steam Engineering of the U. S. Navy, is an interesting one, coming as it does at the close of a brief but brilliant record. It tells what the navy did in the late war with Spain and what it needs. In pleasant contrast to the stumbling inefficiency of the army is tersely stated the celerity of successful naval operations. Quick work was required in fitting out an auxiliary fleet of over 100 vessels, in replacing old, worn out shell boilers by water-tube boilers in various monitors, in furnishing floating machine shops, designing new machinery, refitting old, and providing proper supplies promptly and in working shape. The results are also noted. Nearly all former specifications and methods have been revised, nickel steel will hereafter be used in engine construction, weldless steel tubes will in future have the call, and water-tube boilers meet with unqualified approval. The San Francisco built vessels, the Oregon and Marietta, deservedly come in for special favorable mention. The steam turbine, of which much was expected, is not endorsed. Just tribute is paid the personal efficiency of the U. S. Engineering Corps, and practical recommendation made as to further improvement and permanent value thereof to the nation.

A UTAH MILL BUILDER thinks that next season will see more new mills put up than at any corresponding period in that State's history. He says that many small mine owners are beginning to see that the progress in ore reduction, and the decreased cost in mill construction for the past few years no longer admits of the stacking or rejection of low grade ores; that there is no use in "waiting for silver or lead to go higher," but that business suggests putting in stamps and concentrators, especially the latter. "Some persons," says he, in the Salt Lake *Tribune*, "plead that they are financially incapable of building a mill, and yet month in and month out they will continue to spend money in vain search for shipping ore, when it is as plain as the nose on a man's face that nature has left them with a milling proposition flecked here and there with very rich ore, if you please, and nothing more. The sooner the philosophy of the thing is recognized the better, and, that done, you will see more milling propositions among the successful ones in the camps."

A SPOKANE, WASH., mine operator says that he will "never again have anything to do with the organization of a treasury stock corporation: almost every failure in mining operations hereabout may be traced to that pernicious system." He goes too far

in such wholesale denunciation of a system that at times does not deserve such general verdict, yet, as a steady business proposition the Spokane operator is finding out, as a good many before him have discovered, that the assessment system is the only satisfactory one. True, to the inexperienced or credulous there is a charm in the words "paid up and non-assessable" on a stock certificate or in a prospectus, but that is only a nicely sounding phrase. Those who mean business and contemplate continuous working of the property find fewer obstacles in the assessment plan than in any other co-operative system that was ever devised.

COLORADO'S Commissioner of Mines wants the next session of that State Legislature to pass laws giving him authority to remove explosives from supply stores in mining camps; prohibiting the employment of any but licensed men to run steam engines; prohibiting the employment of such men more than eight consecutive hours in one day; requiring that all abandoned shafts be securely covered and fenced; providing a penalty for failure in reporting accidents; regulating the speed at which men can be raised and lowered in shafts; prohibiting an engineer from operating more than one cage at a time when lowering or hoisting men, and requiring the appointment in all State mining camps of men who shall be under the orders and direction of the commissioner. In Colorado, as in other mining States, there is a general tendency favoring the enactment of such laws, and it is probable that at least a part of them will be on the Colorado statutes at the close of its next legislative session.

At the meeting of the Trans-Missouri Freight Bureau in Kansas City, Mo., on the 6th inst., freight rates on ore and bullion were advanced, the new tariff going into effect Jan. 1st, '99, affecting the smelting and mining industries of the entire region between Utah and Chicago. East of Denver, Colo., the advance over the present rates is \$2 per ton on bullion and \$1 per ton on ore. Utah points are similarly affected. The present bullion rates from the latter State, eastward, are \$11 to the Missouri river, \$12.50 to the Mississippi, \$13.50 to Chicago: on ore, \$9, \$10.50 and \$11.50, respectively. This will occasion a general upset and readjustment of next year's contracts, the loss, as usual, falling mainly on the producer. The effect will probably be a curtailment of production, the extraction and treatment of less "lean" ore, and the abandonment of a class of properties that just about paid expenses under the existing freight tariff.

PURVEYORS of mining stocks in Colorado are offering extraneous inducements. A circular to hand from a mining company offering 100,000 shares of its treasury stock at 15 cents per share urges upon its prospective clients to come and look at the property themselves, and offers to pay all traveling and hotel expenses "from his home to the property and return" of any one buying 10,000 shares. The idea is susceptible of even wider application and is not to be hastily decried. The Colorado railroads and hotels will doubtless look with favor on the proposition. Such inducements have been granted elsewhere, though it is believed this is the first instance where it was publicly announced in a prospectus.

It is a mistake to assert, as it has recently been done somewhat extensively, that the production of gold in the United States in '97 was the largest in the history of the country. The largest gold production for any one year in this country was in 1853, when the yield was 3,144,374 ounces fine—\$65,000,000—\$8,000,000 in excess of the '97 yield. This came almost entirely from California. It is believed that the gold output of South Africa for the current calendar year will even exceed the '53 yield, which has thus far been unexcelled in any year by any country.

In December, '95, Cripple Creek, Colorado, mining stocks sold in the aggregate for 33% more than in December, '98. This in the face of the fact that many of what were then prospects now represent dividend-paying mines, is illustrative of the effects of a "boom" as compared with actual profit-producing property.

THE 76th (29th annual) meeting of the American Institute of Mining Engineers will be held at No. 12 W. 31st St., New York City, beginning Feb. 21st, '99.

Concentrates.

COPPER matte is imported into the U. S. free of duty.

"DORE" bullion is silver containing a small percentage of gold.

SO FAR as known, no California county maintains a mining bureau.

A 20-TON SMELTER is to be built and operated at National City, Cal.

ABOUT 1000 men are getting out as best they can from Dawson to the coast.

THE Portland mine of Victor, Colo., paid \$570,000 in dividends this year.

THE dividends paid for the current year by the Mercur mine of Utah total \$355,000.

MONTANA miners are vigorously protesting against the law requiring safety doors on hoisting cages.

IN ordering boiler tubes, the outside diameter should be given; in ordering wrought iron pipe, the inside.

THE Copper Queen M. Co. at Bisbee, Arizona, has 1200 men on its payroll and its annual product is estimated at \$2,000,000.

THE Columbia, Cal., Exploration & Tunnel Co. now has boring machinery at work at Columbia, Cal., in quest of pay gravel.

THE Kennedy mine, Amador Co., Cal., now with a shaft 2300 feet deep, is about to have an additional shaft 8x17 feet, 3100 feet in depth.

BUTTE, Montana, smelters have been asked to temporarily suspend operations because of the fatal effect of the fumes upon residents.

THE area of an orifice to discharge six pounds steam per second under a gauge pressure of 125 pounds per sq. in., should be three-tenths of 1 sq. in.

IN New South Wales in '97 the average yield of gold per miner employed was £45 6s 8d; in Queensland during that year \$225 18s 3d per miner.

OLD California miners write that the recent "stirring of the elements"—hurricanes, etc.—betoken an extremely wet winter, which would be acceptable.

THE first carload of Fuller's earth prepared in California arrived in San Francisco this week from the mine, three and one-half miles from Famosa, Kern Co.

AT White Cloud, Churchill Co., Nevada, has been discovered a ledge of black hematite iron with a slight percentage of silver. A smelter, etc., is "projected."

THE Holy Terror, South Dakota, 10-stamp mill is credited with a \$70,000 cleanup from one week's run last month—a result equivalent to the name of the mine.

DURING the first nine months of '98, mining machinery was exported to Australia to the value of £349,791; during the corresponding period of '97 the value was £297,250.

THE Supreme Court of Montana has decided that a prosperous working mining corporation cannot dispose of its entire interests without the consent of all of its stockholders.

NEW YORK purchasers have eagerly absorbed the large crystals taken from the McSorley mine, Chili gulch, Calaveras Co., Cal., and present effort is made to find more there.

THE Green Mountain, one of the Anaconda properties, is, probably, the deepest mine in Montana. It is 2200 feet in depth, and an ultimate depth of 4000 feet is contemplated.

ACCORDING to a press dispatch, the transfer papers in the sale last Wednesday of the property of the Dahlonga, Conn., Georgia, gold mine, "required \$9180 revenue stamps thereon."

STATE COAL MINE INSPECTOR YOUNG of Wyoming says there is much activity in the coal mining business of the State, and operators find it difficult to get men enough to work the mines.

A BROKER who retains and claims as his commission the difference between the amount paid by the buyer and the smaller amount asked by the seller cannot be held for embezzlement.

WHERE a man hires to work at a stipulated rate per month, knowing that certain work will be required of him on Sunday, the law will not imply a promise to pay additional wages for such Sunday work.

THE proportion of safety-valve to grate surface in the case of a lever safety-valve is 1 sq. in. of valve area to 2 sq. ft. grate area; with a "pop" safety-valve, 1 sq. in. valve area to 3 sq. ft. of grate area.

THE Museum of the California State Mining Bureau will close Saturday, Dec. 24th, until further notice, pending removal to new quarters in the ferry building, foot of Market street, San Francisco.

SINCE '49 every year with a "9" has seen a big "mining rush." '49, California; '59, Pike's Peak; '69, White Pine and the Comstock; '79, Leadville, Colo., and Tombstone, Arizona; '89, Harqua Hala; '99, —?

"DRIFT MINING" has long been duplicated in the Australian provinces of Victoria, where "dead rivers" have been discovered, and gold-bearing "cement" and gravel profitably followed under the volcanic cap.

A MIXTURE for preventing fumes in mining powder, patented by R. Crowe of Georgetown, Colo., consists of 50 per cent unbolts wheat flour, 25 per cent common salt finely ground, and 25 per cent pulverized bicarbonate of soda.

A "CURRENT UNIT" is such a strength of current that when passed through a circuit one centimeter in length, arranged in an arc one centimeter in radius, will exert a force of one dyne on a unit magnet pole placed at the center, equal to ten amperes.

WORK on the Sutro tunnel began Oct. 19, 1869. On Sept. 1, '78, it had advanced 20,489 feet. At that date the temperature of the air was 95°, and of the water 105° at the header; there was then an average daily flow of 1,285,000 gallons of water.

RECEIPT is acknowledged of the Truckee, Cal., folio, No. 39, and the Boise, Idaho, folio, No. 45, of the Geologic Atlas of the United States. They can be secured from the Director U. S. Geological Survey, Wash., D. C., on transmission to him of 25 cents each.

THE receipt this week of a letter from Manila, Philippine Islands, U. S. A., from a prominent Colorado mining engineer, now a U. S. soldier, ordering this paper sent there during '99, illustrates the fact that a small amount of money can now be

made to go a long way by using a 2-cents American postage stamp. The 2 cents that brought the letter to San Francisco would have carried it to San Juan, Porto Rico, a distance of over 10,000 miles.

THE new mill that takes the place of the one partially destroyed by fire at the property of the Standard Con., Bodie, Cal., is to be fire-proof so far as practicable. Such construction costs considerably more at first, but is more economical in the long run.

IT is suggested that San Bernardino Co., Cal., from which part of Riverside Co. was recently sliced, be still further subdivided by the creation of a new county taking in part of Kern and Inyo counties, covering Randsburg, Ballarat and other mining districts.

THE term "gossan" may be defined as a ferruginous crust filling the upper parts of pyritous veins or forming a superficial cover on masses of pyritic ores. It consists principally of hydrate oxide of iron, resulting from the oxidation and removal of the sulphur, copper, etc.

ON the 5th inst., a decree was entered in the United States Circuit Court, in Los Angeles, Cal., deciding what is known as the School Section cases, the court deciding that Section 36 did not pass to the State of California, which will have the effect of making all mining claims on that section valid.

COLLECTIVELY thanks are returned for the numerous kindly and complimentary references to the recent brief announcement regarding the two-thousandth issue of this paper. More especially are the many private letters appreciated in which the writers say so many nice things as to its present and future.

STATE MINING COMMISSIONER HEWITT of Michigan, in his annual report, mentions the ownership of 800 shares of Calumet & Hecla stock "by a modest drayman of Calumet, who works early and late at his chosen avocation, seemingly undisturbed by the fact that his dividends amount to \$32,000 annually."

DURING 1897 there were 1015 separate fatal accidents in and about all the mines and quarries, more than 20 feet deep, in the United Kingdom, involving the loss of 1102 lives, showing, on comparison with the previous year, an increase of eleven in number of accidents and a decrease of eighty-six in the number of lives lost.

"STATICS" relate only to the action and effect of forces; "kinematics" treat solely of relations of motion; "dynamics" or "kinetics" treat of simple motion as an effect of the action of forces; "energetics" treat of modifications of energy under the action of forces, and of its transformation from one mode of manifestation to another, and from one body to another.

OLD files can be partially resharpened by immersion for a short time in dilute acid. They must be first cleaned. A solution of sulphate of copper will remove iron filings from a file without affecting the file itself. Zinc filings can be dissolved out with dilute nitric acid. Any grease must be removed from the file first. This is best done with dilute caustic alkali.

IN the latest published annual expense account of the Anaconda, Montana, Mining Co., appear some large items; during the year was paid out for timber, \$429,888; labor, \$3,376,502; machinery and repairs, \$461,612; candles, \$1,671; coal, \$207,861; fuse and caps, \$27,004; oil, \$16,979; powder, \$147,298; freight on ore, \$425,081. The total expenses for the year aggregated, \$15,266,611. The receipts for the year were \$18,817,957.

UNDER the laws of the United States, silver is an actual legal tender to the amount of \$5 anywhere in the United States and under all conditions. Above that amount the legal tender feature of the silver dollar is confined to the contracting parties. If the creditor waives the right to specify in what kind of money the debt shall be paid—then the debtor may pay in any lawful money of the United States: silver, gold or currency.

THE largest of California's "dead rivers" known is the "Big Blue Lead," which extends about sixty-five miles, paralleling the main divide of the Sierra Nevada thirty miles west. Its elevation varies from 3000 feet at Forest Hill to 5000 feet at Little Grizzly. The present rivers in that vicinity run at right angles to its course. As a rule, the deep gold is 900 feet; that nearer the surface 929. The gold and gravel are found as deposited in live rivers amid banks, bars, eddies, ripples and falls; little gold in the rapids; much in the eddies. It has yielded about \$100,000,000.

BY the use of a specially constructed device a wire rope 3000 feet long can be cleaned and lubricated in fifteen minutes. The apparatus is made in halves hinged at one side, is closed over the rope either at the surface or brace; above the lubricating vessel is a collar, also in halves, and having six wire brushes which bear upon the rope. The lubricator being charged with oil, the signal is given to the engineer to lower, and immediately the cleaner starts to revolve and to clean the rope. The cleaned portion passes through the oil vessel and thus becomes thoroughly lubricated.

THE electrolytic copper refining industry owes its success very largely to the value of the so-called impurities of the raw copper. Nearly all pyritic copper ores contain silver and gold, and when raw copper from these ores is electrolytically refined, the silver and gold are found as an insoluble "anode sludge" on the bottom of the vats. From this sludge these metals can be obtained as bullion by a comparatively simple and inexpensive chemical treatment. The value of the bullion recovered in one year by the Anaconda Co., at their electrolytic refinery in Montana, was \$3,650,000.

TO ASSAY a quicksilver ore containing arsenic the ore may be mixed with four and one-half times its weight of litharge; heating this in a retort produces a flowing, slag-like mass, formed by the litharge, sulphuret of arsenic, etc., the cinnabar being decomposed into sulphurous acid and metallic mercury. The quicksilver is completely volatilized by a moderate heat, and collects in the condensing apparatus, and the farther portion of the neck of the retort. The one precaution necessary during the operation is to gradually and moderately heat the clay or glass retort, to prevent its being perforated by the effects of the litharge before the process is finished.

SO FAR this year the Jackson Co., Oregon, chicken with 84 cents in gold in its gizzard; the Toledo, Wash., fir tree which, when burned, yielded \$4.73 from its ashes; the Picoacho white gold sold at Yuma for \$21.75 per oz.; with other usual tales are not to hand, though due Dec. 1st, due doubtless to the dry

year. From Montana, however, comes the statement that a Bannack City dredging company finds in its gravel leaden bullets "carrying considerable gold." Besides are also discovered "buckshot and bird shot assaying high in gold." Should Prof. Emmens of argentaurum fame get hold of these in connection with his Mexican silver dollars he might further contribute to the general hilarity.

WEIGHT of hydraulic pipe varies. Capt. Longridge gives a rule for ascertaining the weight per foot of welded pipes of 8 inches diameter and upwards, with 1-16 inch thickness, to allow .67 pound for every inch of diameter; and for riveted pipes, .81 pound for every inch of diameter. For pipes of 2-16 inch, 3-16 inch, 4-16 inch, etc., thickness, the above constants to be multiplied by 2, 3, 4, and so on, according to the thickness. For instance: What are the weights, per foot, of the following welded pipes, and of the same dimensioned pipes, riveted—(a) 9 inches in diameter, 3-16 inch thick; (b) 12 inches diameter, 5-16 inch thick; (c) 20 inches diameter, 1-2 inch thick? (a) Welded, .67 x 3 x 9 = 18.09 pounds—riveted, .81 x 3 x 9 = 21.08 pounds; (b) welded, .67 x 5 x 12 = 40.02 pounds—riveted, .81 x 5 x 12 = 48.60 pounds; (c) welded, .67 x 8 x 20 = 107.02 pounds—riveted, .81 x 8 x 20 = 129.06 pounds.

CALIFORNIA has had the largest hydraulic mining plants in the world, and California miners are putting in equally extensive apparatus elsewhere. At the Consolidated Cariboo Hydraulic Mining Company's property near Quesselle Forks, B. C., J. B. Hobson, an old Placer Co. miner, has put in considerable development work. Two lines of sluices, 7 feet wide, were placed in the bed of the gulch, paved with steel riffles, weighing in the aggregate seventy-nine tons. A canal 7 by 13 feet, ten miles long, was commenced in June and completed Nov. 15. A dam 435 feet long on top and 50 feet high was constructed across the outlet of a lake at the head of the canal for storage of about 550,000,000 cubic feet of water. The construction of this dam and the canal furnished employment for 350 men and 120 horses and cost \$125,000. During the progress of the opening up of the lower or bedrock bench of gravel rich gravel was found. About 75,000 pounds of dynamite, 75,000 pounds of black blasting powder and 100,000 pounds of other miscellaneous mining supplies are used annually at the mine, which has now completed thirty-three miles of canals and three storage reservoirs having a total area of 2184 acres and a storage capacity of 1,016,000,000 cubic feet water. About \$1,000,000 has been expended in equipment of the property since 1894 and about \$500,000 in gold has been recovered during the progress of development work. It is estimated that the company's leases contain about 400,000,000 cubic yards of high-grade gold-bearing gravel. It is proposed to extend and increase and to open up the property in other places.

WHEREVER it is impossible to get water for placer mining, and the conditions are such that a "dry washer" can be used, such apparatus is employed. This device is based upon the same principle as the "farmer's mill," which separates the grain from the chaff, with such changes as are required by the difference in the material to be handled. Many different styles of dry washers are in use in desert mining regions. One general description fits them all, since their difference consists merely in peculiarities of adjusting their several constituent parts, as the angle of the apron, mesh of screen, height and number of riffles, etc. A dry washer consists of a strong wooden frame, to the bottom of which is attached a bellows, the top of which forms the riffle board, consisting of wire netting covered by canvas, across which the riffles are nailed. Above the riffle board is the apron, and above it the screen. A simple crank and gear sets the bellows in motion, and by percussion, gives a shaking movement to the apron. While one man is turning the crank, another shovels the pay dirt onto the screen, through which it falls on the apron and from it on the riffle board. The intermittent blast blows the light particles of dust and sand away, while the heavier ones, and with them the gold, are caught by the riffles. After a number of shovelfuls of dirt (from 50 to 100) have been run through the machine, the riffle board is taken out, the larger particles of gold are picked out by hand, and the rest is dumped on a sheet of canvas, to be once more run through the machine at the close of day, or when a sufficient quantity of the concentrated pay dirt has been collected. Such a method entails loss; still it has been demonstrated that experienced men can save, under certain circumstances, up to 85 per cent of the gold contained in the material worked.

IRON chemically pure is too soft for mechanical purposes, and is rarely found in native masses but mineralized in ores with different elements, metals and substances in the form of oxides, chlorides and fluorides, and when reduced to a metallic state these alloy and combine. Upon these alloys or combinations depends the commercial value of the ore. The mineralized ores of iron are brought through the agency of the blast furnace to a metal of commerce, designated "pig iron," the constituent elements of which are of the utmost importance to the foundryman, for the value and usefulness of the cast metal depend upon them. The allied metals with which iron will combine equally, chemically and mechanically, when reduced in a blast furnace are thirteen. Six of these are electro negative to it and seven electro positive. The electro positive are calcium, magnesium, beryllium, zirconium, aluminum, manganese and zinc. Copper and zinc are pyro-electro and change polarities with iron at different temperatures. The electro negative metals are chromium, vanadium, copper, cadmium, cobalt and nickel. The electro negative metals render iron electro positive, making it cold short, having a crystalline fracture and a polished surface is easily oxidized. The chill is well and clearly defined, white, hard and brittle. The electro positive render iron electro negative, making the iron tough, having an uneven or fibrous fracture and to a limited extent resisting oxidation. The chill has radiant streaks from gray back into chill of combined carbon, giving it a mottled appearance, making the chill tough but not so hard as in the electro positive. The electro and pyro-electro conditions of metals are of interest and may often assist to account for some one of the many peculiar conditions of metal, so often occurring, which the ordinary chemical analysis takes no account of, as it simply deals with iron, carbon, silicon, phosphorus, sulphur and manganese. These alloyed or combined together in certain proportions make what is commonly called "pig iron." The value of this metal depends on these constituent elements and a practical knowledge of them is what is desired by both the furnaceman and the foundryman—the former in making and grading his furnace product, and the latter in buying his metal and making castings to meet certain requirements.

The Refining of Base Lead Bullion Containing Silver, and High in Gold.*

NUMBER VII.—CONCLUDED.

By G. H. BLAKEMORE.

Re-Melting Rough Bars of Silver into Market Bars.—Four half 1000-oz. bars are placed in a crucible standing on two five-bricks, the latter being placed on the fire bars of the remelting furnace. If the crucible was placed on coke only the latter would burn out long before the charge in the crucible was melted and naturally the crucible would sink down until it rested on the firebars, with the result that it would be a difficult matter to get the silver quite molten, through the crucible chilling on close contact with the air drawn through the grate.

When the charge of silver is thoroughly melted down, it is well stirred up and then withdrawn from the furnace by the aid of two men. A basket-shaped pair of tongs is used to grip round the crucible. Over the handles of the tongs, an iron ring is slipped and pressed down tight, so bringing a big strain on the jaws of the tongs, preventing them from slipping off the crucible when the strain of the weight comes on them. The second man has a piece of chain about 3 ft. 6 in. long, one end having a cross bar on it, the other a hook. The hook is slipped under the hinge of the tongs enabling both men to lift. When the crucible is lifted out of the furnace, two or three pieces of soft pine wood, or some soft charcoal, is dropped into it. The carbon of the wood or charcoal extracts the oxygen out of the silver and in two or three minutes the silver may be poured out into some warm, oiled moulds, without any fear of vegetation taking place. Before pouring, however, a dip sample is taken, and this being assayed, the result in fineness is stamped on the two 1000 ozs. bars which each charge produces. Before this is done, the bars are cleaned up with a file and a rough edges are trimmed up with a hammer and cold chisel. Care must be taken in pouring out the silver that any slag floating on the surface is kept back so as not to spoil the bars. Both bars are branded with the same number, and after weighing it is easy to know what the value of the two bars is.

Litharge Assays.—When concentrating retort gold-silver bullion, the following figures, representing the assay value of the cupel and the litharge produced at the time, will serve to give an idea of the variation in litharge assays:—

| Cupel Dip Assay. | | Litharge Assay. | |
|------------------|----------|-----------------|----------|
| Ag. Ozs. | Au. Ozs. | Ag. Ozs. | Au. Ozs. |
| 10,089.2 | 942.5 | 22.96 | 1.12 |
| 14,278.9 | 1,137.8 | 78.90 | 5.14 |
| 17,217.8 | 1,517.6 | 28.32 | 0.36 |
| 15,743.0 | 1,235.6 | 61.18 | 3.38 |
| 13,804.8 | 1,198.4 | 225.75 | 1.04 |
| 4,242.9 | 451.2 | 10.64 | 2.11 |
| 6,602.3 | 523.9 | 18.39 | 1.26 |
| 13,814.1 | 1,794.5 | 11.48 | 2.45 |
| 16,775.2 | 2,128.8 | 17.07 | 4.29 |
| 12,341.8 | 1,634.4 | 23.16 | 1.60 |

There is nothing regular about them, *i. e.*, high cupel assays do not necessarily mean high assay litharges. As much of the litharge as is possible is returned to the softening furnace to assist in the oxidation of the antimony, in preference to returning it to the blast furnaces.

Parting Dore Bullion.—The process of parting which seems to me the quickest, cheapest and most efficient with small plant expense, is the Gutzow process. For an expenditure of £550, a plant can be erected which is capable of handling with the greatest ease 200 lbs. of dore bullion every twenty-four hours, and with an extra expense of about £100, its capacity could be trebled most comfortably. All that is required in the plant are the following items:

1.—One 500 gallon tank on a stand 8 feet high to supply water to the plant. A steam pipe fitted to it to enable hot water to be produced, or the water from steam traps in the refinery can be used. 2.—One parting kettle, cast iron, with moveable hood also cast iron. Kettle told 1000 lbs. concentrated H_2SO_4 , set over fireplace. 3.—One small lead condenser to catch sulphuric acid fumes from the kettle, 10 ft. 0 in. x 7 ft. 0 in. x 5 ft. 0 in. made of 4 lbs. to sq. foot lead. 4.—Two cast iron pans about 6 ft. x 3 ft. x 1 ft. deep. 5.—Two lead lined wooden boxes with antimonial metal plug cocks. Size of boxes 2 ft. 0 in. x 18 in. x 18 in. 6.—One lined wooden box 6 ft. x 1 ft. x 6 in. x 1 ft. x 6 in. to hold precipitated copper. 7.—One recovery box, eight compartments, made of 2 in. soft pine each, compartment 2 ft. wide, 4 ft. deep, and 4 ft. long. This is to be filled with scrap iron. 8.—One drying pan of cast iron, 5 ft. x 2 ft. 6 in. x 6 in. deep, set over fireplace. 9.—Three leaden buckets to hold acid. 10.—One iron paddle 4 ft. long of $\frac{1}{2}$ in. round iron. 11.—One iron ladle to hold about one pint, $\frac{3}{4}$ in. iron handle. 12.—Two trowel-shaped tools. 13.—Six wooden paddles 1 in. round; handle blade of paddle 6 in. x 4 in. 14.—Set hydrometers; twaddles. 15.—Two or three beakers. 16.—Some glass rod. 17.—Scale to weight $\frac{1}{2}$ ton. 18.—Remelting furnace for gold. 19.—Three

pairs india rubber gloves. 20.—Three pairs india rubber boots to reach to thighs. 21.—Three woollen sweaters. 22.—Steam connection with hoses fitted with leaden pipe, $\frac{1}{2}$ in., $\frac{1}{4}$ in. hole in end. 23.—Water supply laid conveniently to various parts of buildings and fitted with "roses" if wanted. 24.—Building over the lot.

I simply propose to give a description of the above process and give actual working facts. Descriptions of all other processes for the parting of dore bullion can be found in almost any work dealing with the metallurgy of silver and lead.

A charge of 200 lbs. of dore, or whatever amount the kettle is for, is placed in the kettle with $\frac{1}{4}$ to $\frac{1}{2}$ lbs. of concentrated acid per lb. of dore silver. The dore is not granulated, but is used up in bar shape as it is cast from the cupel. In about two hours' time a jar or two of the mother acid is used (which is got when the process is working regularly) until all the silver dissolved—usually after three to four hours boiling. Then fill up the kettle to within an inch of the top with the mother acid before spoken of, so as to give about $\frac{1}{4}$ lbs. of acid to each lb. of dore silver charged. Generally a lot of sulphate of silver, of both kinds of sulphate, precipitates when the cold acid is added. Sometimes so much of this comes down that it is necessary to heat the contents of the kettle to boiling point again. When the silver has mostly gone into solution, use the ladle described and bale the gold powder out. The pan having a circular depression in the center of the bottom, this can be readily done. When the gold is all out, the kettle is allowed to stand for about half an hour and then the contents are syphoned out (to within 2 inches of the bottom) into a cast iron pan with or without a water jacket, the former for cooling purposes. The syphon is simply a piece of $\frac{1}{2}$ -inch pipe bent to the shape desired. When using it, the pan end has a plug of wood driven in so that it can be easily removed, or else a small cast iron plug cock could be fitted on. The pipe is then filled with some of the mother acid, and the kettle end is quickly put under the acid and the plug opened rapidly; this syphon seldom "misses."

As soon as the kettle is emptied, the steam is turned on to the pan, carefully of course, so that the lead pipe does not blow out of the liquor. A test taken by dropping some of the liquor on a cold plate will show when the steaming is finished. When there is plenty of bisulphate of silver in the liquor, a spot of it sets in a solid lump like a drop of candle grease might do. It is also white in appearance. When the silver is all as sulphate, the drop on cooling shows a few sulphur yellow crystals and a quantity of liquor around it. It is advisable, however, to make the workman use a hydrometer test as well, but in combination with the crystallizing test. It is not necessary to run the liquor down lower than 135 degrees T. At first the right point takes some explaining to the men and personal superintendence, or they may give the pan too little steam and get the silver crystallized out principally as bisulphate, or give it too much and so produce very dilute mother acid. In the start of operations it may take ten hours steaming to bring the liquor to the point required, but when there is mother acid to return to the dissolving kettle, three hours is usually sufficient. Immediately the liquor has been sufficiently diluted by the steam, the latter is shut off and the pan allowed to stand for 24 hours, *i. e.*, presuming it has no water jacket. A few minutes the next morning will draw off the mother liquor and in an hour all the crystals may be shovelled out into a leaden box, leaving room for the next charge of silver solution, which should be ready to syphon out of the dissolving kettle.

The crystals are washed with hot water, which takes the copper and iron sulphates, etc., out, first in a box by stirring and decanting off the liquor, and then in a box on wheels, lead lined, with a false bottom, and lined with a piece of ordinary unbleached calico, tacked on. Hot water is run on and about four washings given. The crystals are then removed to the drying pan. A couple of hours will dry the crystals and the dried sulphate of silver is ready for heating in a retort. A retort holding 560 lbs. of alloy will hold 260 lbs. of sulphate of silver. It is mixed with 4 to 5% of ground coke or charcoal, and four hours heating is sufficient to reduce it to metallic silver. It is advisable to put about 5 lbs. weight of fireclay or any siliceous material in with the charge to prevent the retort being eaten out at the line of the molten charge. The following assays show its fineness:

| | |
|-----------|------------|
| 1. 996.40 | 7. 985.00 |
| 2. 995.30 | 8. 997.30 |
| 3. 998.30 | 9. 990.10 |
| 4. 996.30 | 10. 996.10 |
| 5. 994.30 | 11. 996.80 |
| 6. 994.60 | 12. 997.50 |

There are no very troublesome fumes given off, beyond a smell of sulphur that inconveniences no one. The bars are afterwards melted up on a new cupel and a couple of hours' heat with a little blast will bring the silver up to 998 fine.

All the washings from the sulphate of silver are run through a box holding precipitated copper and any silver in solution is precipitated there. The copper which it replaces, and silver not precipitated, is caught outside in the recovery box filled with thin

scrap iron. Daily tests of the waste liquor from this box have failed to show the faintest trace of copper or silver escaping. Once in a month the first two compartments of this box are cleaned out. About 50 lbs. weight of precipitates are obtained. This is simply put back into the copper box. One assay of this material is as follows: 53 15 per cent Ag.; 10.40 per cent Cu. The rest was iron, dirt, etc.

The gold, at the end of the week, is put back into the kettle, with about 1 lb. of acid for 2 oz. of gold and boiled with frequent stirring for about three hours. The gold is then ladled out while the liquor is simmering into a lead-lined box, and well washed with hot water. This removes all the copper and most of the silver.

It takes two or three hours to well wash it. It is then simply put into a crucible and melted up. No refining need be done beyond this because the gold is usually from 980 to 995 fine. It is no advantage in New South Wales to make it particularly fine, because the Mint makes no more allowance in its treatment charges for gold 1000 fine than it does for gold 500 fine. In quantities under 5000 ozs. the charge is 4d. an ounce on standard gold (not fine gold) whether the gold is absolutely pure or the dirty stuff which stamp batteries turn out. This surely is clinging to the memories of antiquity with a vengeance, and it is to be hoped that some more modern business ideas will be inaugurated very shortly in an institution which is one of the most useful in regard to the mining industry which the colony possesses.

If it is desired to make nice-looking bars, all that is necessary to do is to pour about $\frac{1}{4}$ th of an inch of oil into the moulds. When the gold is poured in, the oil rises on the top and burns off, leaving the face of the bar bright and yellow. A little powdered borax sprinkled on will complete the cleaning. Then tip the red-hot bars into cold water and from there place in a weak pickle of sulphuric acid. Scrubbing with a brush cleans everything off leaving the bars as bright as a sovereign.

I forgot to mention that the silver sponge, which collects in the copper box, is collected weekly and put into the gold-washing box with about 20 per cent by weight of sulphate of silver crystals, and the box filled up with hot water. Any particles of copper are thus decomposed at the expense of the sulphate of silver, which is reduced to the metallic form. All washings, whatever from, are always passed through the copper box, and if this practice is adhered to there can be no possible chance of loss. The washings from the gold are first run into a canvas filter and any gold which collects there is simply cupelled off and recovered.

SAMPLE ASSAYS OF DORE BULLION TREATED.

| Fineness in Silver. | Fineness in Gold. |
|---------------------|-------------------|
| 1. 892.00 | 103.90 |
| 2. 938.00 | 56.78 |
| 3. 941.40 | 53.42 |
| 4. 931.50 | 67.79 |
| 5. 924.00 | 74.18 |

The gold as it comes out of the dissolving kettle, when the dore bullion is as rich in gold as the examples given, looks like coarse red sand. It is only when the gold is much more diluted with silver that it is obtained as a black, finely divided powder.

Assays of silver produced by this method showed that it contained 0.96 ozs. of gold per ton downward to a trace. The cost of parting per oz. is under one farthing, *i. e.*, from 0.19d. to 0.21d.

The average cost of refining base bullion under the circumstances described in this article is not more than 28s. a ton. With cleaner bullion the cost could be very considerably reduced, for like everything else in this business the impurities determine the expense.

Dangerous Practice to be Avoided.

TO THE EDITOR:—On my travels, looking at copper mines and reduction works, I have examined the works of the — furnaces. Here they carried away the slag, left over in the converters, in single-truck, conical slag pots. When the slag was thought to be cooled off sufficiently it was dumped on a pile and the possible "kings" broken off. In order to expedite matters the laborers would squirt water on the slag, still hot in the pot, with the occasional explosion of some slag cones. Neither the general manager, superintendent, foreman nor gang boss would pay much attention to these explosions, accompanied with deafening, thunder-like noise. Sometimes it would happen that the ignorant laborer got burnt or even very seriously mutilated, as happened one morning while I was at the works. No one seemed to know the cause or apparently cared, these laborers being of low humanity and education, and lots more to be had in that country. The company had in its employ a very good metallurgist and assayer, too, but he either did not take time to look into the cause of this trouble or did not care to show his superiors his greater knowledge (not always safe for a long tenure position).

As a rule, it is a pretty fair sort of man that can mind his own business, so I, being a visitor, did not

*Australasian Institute Mining Engineers.

wish to parade understanding of things that ought to have been attended to by the general manager.

The obvious lesson taught is this: Copper in the liquid state absorbs large quantities of oxygen; when cooling gives it off again. The slag under these conditions is porous and the water sprinkled on converted into superheated steam. Let this get united with the escaping oxygen and the contact of sufficiently hot slag, and you will have a first-class explosion, with possible loss of life and limbs. Moral: Don't get water in contact with your hot slag, or slag pots while full of hot slag. K. E. RYPPHA.

Improvements in Wire Rope Tramways and Cable Hoists.

Among recent improvements in wire rope tramways are those in the Bleichert system, manufactured by the Trenton Iron Company of Trenton, N. J., notable being the patent locked coil track cables and the Webber patent compression grips. These are now used exclusively on all lines of this kind manufactured by them. The locked coil cables present a smooth surface for the carriage wheels to run on under all conditions. This style of cable is stated by the manufacturers to have overcome the difficulty experienced with broken wires, which result in unstranding of the wires, leaving a rugged surface, causing rapid wear of both the cable and the carriage wheels. The Webber grip dispenses with the necessity for lugs on the traction rope, the life of which is thus extended, as the wear is distributed over the entire rope, instead of being confined to certain spots.

Among the Bleichert tramways now in course of erection is noticed one 7000 feet long, of five tons hourly capacity, at Topia, Durango, Mexico, for the Miller & Sibley Mining & Milling Co. of Franklin, Pa.; one 6100 feet long, of ten tons hourly capacity, in British Columbia, for the Fairfield Exploration Syndicate of Vancouver; one 12,700 feet long, of twenty-five tons hourly capacity, for the Highland Boy Gold Mining Co. of Salt Lake City, Utah, and one 8550 feet long, of twelve tons hourly capacity, at the Camp Bird mine, Colorado, for T. F. Walsh of Ouray. The latter contains an angle station which practically divides the tramway into two independent sections. In all of these lines there is a fall in favor of the loads sufficient for gravity to operate,

and in most cases the power developed will be utilized in carrying up back freight to the mines.

A line for the Plymouth Cordage Co. at Plymouth, Mass., which is just completed, contains some novel features of interest. This line is about 1150 feet long and will be used for carrying baled hemp from the warehouse to their mill. At one point the lines make nearly a right angle bend, around which the cars pass without being detached from the traction rope or manipulated in any way, demonstrating the feasibility of passing angles without detaching. The structural work of the line at Plymouth is of steel. Near the angle station the line passes over railroad tracks spanned by a bridge. Cars of special design are used, and along the warehouse for a distance of 500 feet shunt rails extend, so that the cars can be loaded at numerous points, special apparatus being provided for releasing the traction rope while the cars are being loaded.

In the way of hoist conveyor plants, for handling heavy loads, is also noted one recently built for the United States Government at St. Paul, Minn. This makes a clear span of 1150 feet across the Mississippi river, and is used in the construction of one of a system of four locks now being built for the improvement of the river navigation under the supervision of Major F. V. Abbot. The supporting towers are mounted on trucks and may be moved as desired, and in this respect the line is similar to those used in the construction of the Chicago Drainage Canal. The distinguishing feature of the line is the absence of fall rope carriers, known as the

HEAD SUPPORTING TOWER HOIST CONVEYOR PLANT.

SUPPORTING TOWER ST. PAUL, MINN., HOIST CONVEYOR PLANT.

CABLEWAY HOIST CONVEYOR FOR U. S. GOVERNMENT ACROSS THE MISSISSIPPI AT ST. PAUL, MINN.

Laurent-Cherry system, and is fully covered by patents owned by the Trenton Iron Co. This line has been in satisfactory operation for some time. The local representative of the Trenton Iron Co. is Newton M. Bell, 109 California St., San Francisco.

The Paris Exposition of 1900.

TO THE EDITOR:—The recent Miners' Convention held in San Francisco made the first practical move toward taking action in regard to the Exposition of 1900, in the appointment of a committee on California's mineral display for the Paris Exposition. When is taken into consideration the vast amount of labor required for making such a display as California can, and should make, a year's time is none too much for preparing and getting all in place for the opening, 1st of January, 1900, and it is to be hoped that no time will be lost by the committee after the 1st of January, 1899. The question of expense and to what extent the work is to be carried should be carefully considered, for unless the State can make a creditable exhibit, it had better make none. This question will have to be settled by the Legislature, for if no appropriation, then no exhibit. The importance of a large and attractive display of all of California's products can be forcibly understood when it is known that there was at the Exposition of 1878 16,156,628 admissions. At the Exposition of 1889 at Paris California made no exhibit. The California Paris Exposition Committee of 1878, of which Almarin B. Paul was chairman, had a hard time financially, until Jno. W. Mackay came to the rescue with his check for \$5500. This enabled the committee to complete a fine collection, which was carefully classified by Prof. H. G. Hanks, also one of the committee and who was made one of the special commissioners for California to represent the State in Paris. The collection as there displayed created great interest, and it was asserted that within two years after the Exposition closed at least \$5,000,000 in French capital came to California for investment in our mines. This is just what we want to bring about now by showing the vastness of our mineral wealth, not only in gold, silver and copper, but our other mineral products. I read with pleasure your suggestions regarding this matter in the issue of the 3rd. The press of the State and every miner should give hearty co-operation to the end of having a first-class collection.

PROGRESS.

A Zinc Process for Precipitating Gold From Weak Solutions.

Recent reference herein to the practical economical cyanide methods of W. K. Betty, cyanide manager at the Crown Deep mine, Johannesburg, S. A., makes the following of additional value. It is condensed from a paper on that subject written by T. L. Carter and read at a recent meeting of the Chemical and Metallurgical Society of S. A., as reported in the society's journal:

This process is an important extension of the zinc precipitation process, and will prove of benefit to the industry. The Crown Deep slimes plant had originally six Siemens & Halske boxes; now only half of one box is used, that being sufficient for the zinc method of precipitation. The boxes are 40 feet long, 6 feet broad, 5 feet deep, divided into nine compartments. As in the Siemens-Halske process, it is necessary to have the solutions as clear as possible before passing them through the box. For this are two receiving tanks, 36 feet in diameter, 12 feet deep, with sand filter beds. From these tanks the solutions are pumped into a small wooden tank at the head of the box. A 4-inch pipe carries the solution from this small tank to the precipitating box. The rate at which the solution flows through the box is from fourteen to fifteen tons per hour. This seems large when compared with the rate of four tons per hour, used by the Siemens-Halske box.

An important point is the preparation of the zinc. After it has been cut on the lathe it is taken to a trough containing a solution of acetate of lead of about 10 per cent strength. The zinc is thoroughly washed and stirred in the solution until it becomes of a dark hue. If it is not thoroughly stirred, only the outside of the mass of zinc will become coated, the inside remaining quite bright. An empirical way to note if the solution is strong enough is to look at the zinc, and see if it is sufficiently and thoroughly coated. After thus preparing the zinc, it should be placed in the box, and covered with the auriferous solution as quickly as possible, since leaving it in the air seems to adversely affect it.

The next important point is the addition of free cyanide at the head of the box. Twenty pounds of KCN are dissolved in an iron tank, holding about 75 gallons water. This 2½% solution is allowed to run freely into the auriferous solution entering the box for four hours, raising the strength of the solution passing through from .007 per cent to .025 per cent. When the 20 lbs. of KCN are finished another 10 lbs. are dissolved as before, and freely run into the box, taking six hours, and raising the solution about .007 per cent higher. The addition of the cyanide as described must not be neglected. It is absolutely necessary at the commencement to let this free cyanide run into the box. Twelve or fourteen hours after starting a slow drip is allowed to fall into the solution as it enters the box, bringing up the strength of the solution going through the box from .007 per cent to .008 per cent, and this is dropped in through the run of the box.

The first four or five days the precipitation seems quick and almost perfect. An assay of the solutions in different compartments on different days showed that at first all the precipitation was done in the first two compartments, the lower compartments receiving little gold. After a while, however, the first compartments ceased to act so well, and the percentage of precipitation in them was greatly reduced. Gradually the top compartments did less and less, the lower compartments now doing their share in the precipitation. After ten or eleven days the zinc in the upper part of the box becomes "dead," and rises to the surface. A good plan would be to prevent the zinc from rising to the surface by means of thin screening, for when the mass floats on the surface it is continually knocked against the sides of the box and very minute particles are carried away. It might be said that the zinc in the other compartments will catch these particles, but the zinc there is not in a condition to do so. This mechanical loss is the reason why the solution at the foot of the box gives such a high assay value after the box has been running for a prolonged period. The longest time the box has been run with continued good precipitation without cleaning up was twenty-two days, for which period the assay value of the solution entering the box was 36 grs. and at the foot 3½ grs., giving a precipitation of 90.2 per cent. Note, however, the assays for the last few days—9 grs., 4½ grs., 7.7 grs., 7.2 grs. and 18 grs.—showing that after a time the box ceases to act satisfactorily.

Cleaning up the box is considerable bother when the zinc has to be dissolved. So far the gold slimes from the slimes plant have been kept separately and smelted alone, but it is intended to make the slimes plant simply a preparatory place for the zinc used in the sand boxes. When this is done the trouble from "dead" zinc will be obliterated and a precipitation of 96 or 97 per cent expected to be obtained. After a few days run the zinc from the slimes plant will be taken out and put into the weak solution boxes of the sand plant, just as these boxes

require fresh zinc. Heretofore has only been dissolved the zinc in the first two or three compartments, that in the lower part of the box being used to charge the top section of the new box. It is not advantageous to use the old zinc for the top of compartments of a newly started box for it is somewhat dead; best results have been obtained when freshly cut zinc was used throughout. The improvement will be noted when this zinc can be used in the sand plant, starting each time with new zinc throughout. In order to facilitate taking out the zinc is a block and tackle running the whole length of the box. By fastening it into two hooks at the ends of the tray carrying the zinc, the material can be easily lifted from the box; the zinc was dissolved in the usual way.

"Smelting the material gave us great trouble at first, but I trust the other assayers on the mines will not have the bother we had at first, and that these remarks on the smelting of the slimes will be of some service. On account of adding so much lead acetate, there is a large percentage of lead in the auriferous zinc slimes, naturally. An analysis for lead showed that a sample I took contained 23 per cent of this objectionable metal, besides 5 per cent of other base metals."

The first method used was to reduce the base metals with crude tartrate of potash, bringing them down in the metallic state with the gold. Borax 65 per cent and Na₂CO₃ 9 per cent made up the rest of the flux. This worked quite well, giving a splendid fusion and a clean, bright slag, practically free from gold and silver. The base metal formed a thick layer on top of the button of gold, which came off quite readily by chilling with water. Assays showed that the matte ran 3.9 per cent gold and 5.1 per cent silver. The mattes were put in the safe, and, when a large quantity had accumulated, were smelted down and purified. The gold buttons were put into a clay-lined crucible, and when in a molten condition a shovel of niter and a little sand were thrown in, then after a few minutes a handful or two of bone ash was added. The oxides were skimmed off and the same process repeated until a fineness of 834 was obtained.

A successful way to oxidize the excessive base metals is to employ a light blast of air. In the assay office is an air tap, from the compressor upon which a hose is fitted. From this source the air is obtained. Care should be taken to use a clay-lined crucible, to prevent the litharge from being reduced by the carbon of the crucible. After thorough oxidation, if a flux of borax 5, sand 1, Na₂CO₃ 2 parts is added, the bar can be poured after the flux has thoroughly fused.

In experiments in the laboratory to find out if the slimes could be somewhat purified by a wet method, the slimes were treated with HNO₃ after the treatment by sulphuric acid, and although a large percentage of the lead was thus dissolved, there still remained about 6 per cent of it. Hydrochloric acid was tried with little success, also acetic acid, which dissolved most of the lead. It might be a saving if a cheap, workable wet method could be found for refining the slimes, thereby dispensing with the rather expensive clay liners, which have to be used now if fine bullion is desired.

There seems to be a growing desire on the Rand to get the bullion as fine as possible, to eliminate everything save the gold and silver. Now the great agent for this work is oxygen, and it is a matter of importance to use the substance which gives oxygen most cheaply and efficiently. The two substances mostly used there are MnO₂ and KNO₃. The question arises, which of the two is the best oxidizing agent? It appears to Mr. Carter that nitre should be used entirely as an oxidizing agent.

The best results were obtained by the following flux, which he worked out for the product from the slimes works, using clay liners: Borax, 60 per cent; niter, 19 per cent; sand, 11.5 per cent; soda, 7 per cent. With this flux, bullion of 876 fineness was obtained.

Care should be taken in recharging the pots. There should be some of the former charge unmelted on the surface, for if more of the fluxed auriferous zinc slime is placed in the pot when the contents are molten, violent boiling will ensue, with danger of considerable loss.

Regarding the possibilities of the process, what it might do in the future, it seems it may make the zinc process more applicable to gold-bearing ores of all description than before. One drawback to the use of the cyanide process for ores rich in copper pyrites was that if it is used .2 per cent to .3 per cent of cyanide solution on such ores, the copper will decompose all the potassic cyanide, and if the gold and copper go into the boxes to be precipitated, the copper will coat the zinc and greatly interfere with the precipitation of the gold. The drawback was somewhat overcome by the Siemens-Halske process, which made use of very weak solutions and succeeded in precipitating the gold from them. In the future ability is anticipated to manage solutions as low as .005 per cent by the zinc precipitation method.

The president, in his inaugural address, said that he thought by the use of warm water the extraction from sands would be accelerated and increased. If this is made practical on a large scale, the amount

of potassic cyanide used on the fields can be greatly reduced, for the weak solutions can be effectually precipitated by the zinc method.

Care must be taken in the assaying of the solution at the top and bottom of the box. Two methods are used—evaporation in lead dishes and the silver nitrate method.

During the three months' trial: Tonnage slimes treated, 11,280; assay value, 3,157 dwts.; actual extraction, 87.49 per cent; tonnage solution used measured by water meter, 21,842 tons; assay value entering box, 36 grains; gold contents, 1645.679 ounces fine gold; gold recovered, 1557.847 ounces fine gold, equal to an extraction of 94.6 per cent of the solution treated. Working costs, 2s 9d per ton; profit, £4984 8s 11d, equal to 9s per ton treated. Cost of cyanide equal to 3½d per ton treated.

Working costs include all the zinc put into the box, and sulphuric acid used for dissolving same. "We do not anticipate that working costs will be higher than 2s for October and 1s 9d for November. I might state that so far the actual extraction has been over the theoretical.

"Thus, gentlemen, you have the results of our three months' test. The use of lead in conjunction with zinc was patented by Mr. MacArthur early in the historical year 1894. Mr. Betty makes no claim for originality for that part of his process. What he does claim, though, is that by a happy conjunction of free cyanide, lead and zinc he gets an almost perfect precipitation from solutions so weak in cyanide that it was formerly considered hopeless to attempt to make them amenable to precipitation on zinc in an ordinary zinc box."

Mill Work Results.

TO THE EDITOR:—The following results of some of the runs made at the Garnet G. M. Co.'s mill at Pony, Montana, the past season may be of interest:

July 27th to Aug. 13th—16 days 1½ hours' net running time for twenty stamps—918 tons of ore were crushed, of an assay value of \$5.76 per ton, or a total gross value of \$5287.68 for the lot.

This yielded gold bullion worth \$2473.03, per mint returns, and concentrates worth \$2115.75, as per Butte smelter returns; a total of \$4588.78, or 86.7% of the assay value of the lot. The net returns for bullion was \$2463.26, and for 77,442 lbs. dry concentrates, \$1645.93.

In 19½ days' calendar time, or 17 days' net running time, from Aug. 17th, 3 P. M., to Sept. 2nd, 11 A. M., 1027 tons of surface lead ore was crushed. The assays showed a saving of 70% of the gold and silver and 75% per cent of the lead. The lead was largely sulphate, with some carbonate, the balance galena. The gold is carried almost entirely by the iron and copper sulphides associated with the lead. These were mostly oxidized in this lot of ore, the gold also appearing to be in the particles of oxides carried over in the tailings. Finer crushing was tried, but proved unsatisfactory.

From Sept. 2nd, 3 P. M., to Sept. 22nd, 3 P. M.—17½ days' net running time—1017 tons milling ore was put through. Assay value, \$5.30 per ton, \$5390.10 for the lot. The working results were \$2659.58 worth of bullion and \$1589.64 in concentrates, a saving of 79% of assay value.

Twelve hundred and thirty-three tons were crushed from Sept. 22nd, 3 P. M., to Oct. 17th, 5 P. M., in 23 days actual running time. This lot had a total assay value of \$5462.19, or \$4.43 per ton, and gave \$2636.10 in bullion, with \$2353 in concentrates.

Thirty-mesh steel wire screen was used, the screen frame being 4'4" x 12", with a 2" vertical center strip. The screens lasted about 7 days each. With new dies a chock block was used, being replaced from time to time by shallower ones, to keep the discharge nearly uniform. This was kept as near 5" as practicable. The drop was from 6" to 9" and 80 to 85 per minute.

The gold in the ore is in exceedingly minute particles and worth \$13 per ounce, the alloy being silver. Numerous tests of ore and pulp failed to show the color, and even when quicksilver was fed with the ore no gold or amalgam was found in the mortars.

The pulp was sized before passing to the vanners. Canvas plant tests showed a vanner saving of 95% to 98% of the concentrates. The smelter returns showed from 13% to 18% silica in the concentrates.

The details of expense are not at hand. In the summer's estimate the cost at the mill was under 40 cents per ton of ore worked, the total for mining, milling, etc., being within \$2 per ton.

Igo, Cal., Dec. 12th, '98. E. L. BALLOU.

A NEWLY PATENTED contrivance is one which automatically shuffles playing cards. It has a flaring mouth at the top, in which the cards are placed to drop down on a slotted grate, the latter being shaken by a handle to drop the cards into a channel leading to the base below, where the cards fall. This contrivance should avert the loss of life incident to the difficulties which will occur in games of chance where the dealer is always an object of suspicion.

The Handling of Dynamite.

Mine Inspector Byrne of Montana, in his annual report to the Governor, presents some points as to the handling of dynamite. Among other things he says that dynamite should be stored in a cool, dry place. Nitro-glycerine is a liquid with a high boiling point, but it evaporates sensibly at temperatures a little above the normal. At a temperature of say 100° Fahr. the loss is serious in proportion to the time of exposure. In this way the powder may be much weakened. In a damp place it will absorb moisture, and if it is stored for any length of time it will be spoiled.

Probably two-thirds of the fatal accidents that have happened with dynamite have come from careless methods of thawing. Dynamite freezes at about 45° Fahr. In this condition it is stiff and hard and should not be used for blasting, as it is insensitive to the ordinary detonator. The powder is a poor conductor of heat, and for this reason it freezes and thaws slowly. The time required to thaw it thoroughly when it is once solidly frozen is much greater than most people think. Shut up in the boxes in a magazine, it will remain frozen even in summer for many weeks.

The thawing of dynamite is always attended with danger if it is done rapidly at a high temperature. The danger is in direct proportion to the temperature. No matter how urgent the haste may be, the temperature used should never exceed 100° Fahr. A dry heat should be used—that is, the powder should not be brought in direct contact with hot water or steam. Water tends to make the nitro-glycerine exude and also attacks the chemical salts in the composition. Where the object justifies the expense it is a good plan to keep the interior of the magazine at a moderate temperature, say 60°, which will prevent the powder from freezing.

Steam pipes should never be used inside of a building where powder is stored. The best method of heating is the well-known hot water system used for dwellings. In this the circulation is active and the arrangement such that the water cannot be brought to the steaming point or even be overheated. It has been found that a maximum temperature of 104° in the water gives an active circulation. The heater is located at a safe distance and the water circulates through pipes in the building and returns to the heater. The pipes outside the building are well protected and covered to prevent loss of heat, and the building should be made as impervious to heat as possible.

Double walls, floors and ceiling with a sawdust filling answer every purpose, but the building must be made absolutely tight. A crack under a door or a window will counteract the best heating system that can be made.

If steam is available, a very cheap and efficient system of heating a small building is as follows: On the outside of the building a sheet iron drum is set up and connected with another inside. Two pipes pass through the wall connecting the drums near the top and bottom. The outside drum is set a little lower than the other to provide for the overflow of the water. The holes through the walls are packed around the pipes with waste or tow. Water in the outside drum is heated by a small steam pipe and circulates through the drums. The room is kept warm by the radiation from the inside drum. If the building is tight and properly insulated the amount of steam necessary is very small. To prevent the vapor from making the room damp, the drums are closed on the top with wooden lids covered on the under side with cloth soaked in paraffine. The sheet iron drum used for the transportation of glycerine or coal oil is well suited to this work.

When dynamite is being used in winter on a large scale, as at a mine, it would pay to build a small thawing room of this kind, say 12x16. The powder needed for the day's consumption could be carried in and left for 12 hours or more—the boxes being simply opened or the powder taken out and put on shelves, depending upon the time available. A temperature of 75° or 80° maintained during the night would suffice to thaw the powder. A thermometer should always be consulted to regulate the temperature of the room, which should not exceed, say, 85°.

This particular arrangement for a thawing room is convenient, but it may be varied to suit the case. The essential feature is a tight, heat insulated room kept at a moderate and regulated temperature.

The plan of a thawing room is much better than using thawing stoves. The best of these are liable to get out of order, if not originally dangerous. The thawing room has great capacity, so that the work need not be done in a hurry, and has always this advantage over small apparatus. Any excess of temperature brings discomfort to the operator and so gives warning. A room in which a man can work without distress is reasonably safe for thawing dynamite.

In no case should any apparatus for thawing powder be used in a magazine or building where a large quantity of powder is stored. The same warning

applies to the handling of caps in the preparation of primers.

In charging a drill hole use a wooden tamping rod. If the hole is dry, cut the cartridge into short lengths and slit them along the sides, so that when driven down with the rod the powder will spread and fill the inequalities of the hole. The primer, with the cap carefully attached, should be put in last—that is, on the top of the charge. The hole is then to be filled and tamped with care. Earth or clay mixed with gravel makes one of the best tamplings. In a wet hole leave the cartridge intact for the better protection of the powder. The water which surrounds the cartridges will transmit the blow to the rock, but use tamping in every case. Some miners do not think it necessary, but it is the only way to get the best results. The powder gases tend to act in the line of least resistance. If this work is not properly done a part of the energy will be expended through the open drill hole or in blowing out a weak tamping before the gases have done their work on the rock.

There are two reasons for putting the cap at the top of the charge. If it is buried in the mass of the charge, the fuse in burning down to it may set fire to the powder by side spitting and burn up a part of it before the cap explodes. The other reason is this: The detonation is not instantaneous. It begins at

deflected the bob from its vertical position to such an extent that the bottom of two lines were 7.5 millimetres farther apart than the tops of the same lines, forming an angle of six minutes.

New Pipe Line of the San Gabriel Electric Company.

All the pipe for this great project was made in sections 15 feet in length at the Lacy Manufacturing shops in Los Angeles, Cal. The accompanying illustration gives an idea of the difficulties connected with this undertaking. The pipe is laid on a mountain slope at the mouth of the San Gabriel canyon, extending from the end of the company's tunnel to the foot of the mountain, 940 feet, with a perpendicular fall of 400 feet to the company's power house.

The pipe is 36 inches diameter, made of $\frac{1}{2}$ and 1-inch steel plate. One of the main difficulties encountered in this work was the laying of the pipe down the backbone of a ridge; as no ditch could be dug to hold pipe in position, great care had to be exercised to prevent the sections of pipe, as they were being hoisted to their position, from rolling off into the canyons on either side of the ridge.

The 15-foot sections were hoisted into position by a wire rope tramway, the remaining joints being made on the ground. The largest part of this entire

LAYING PIPE FOR THE SAN GABRIEL ELECTRIC COMPANY.

the cap and moves by a wave or impulse through the powder. The detonation proceeds in lines radiating from the cap and the greatest effect is in the direction of the greatest dimension of the powder; as a bottoming effect is usually required, the best place for the cap is at the top of the charge.

The gases given by an explosion should be colorless and invisible. The visible smoke consists of solid products formed in the reaction and of dust made by disintegration of the rock. The best gases are those of a complete detonation. To insure this strong detonators should be used, and the powder should be in good condition and the charging should be done with care. It is very essential that the cap should be in actual contact with the powder.

It should be kept in mind that the gases given by the best powder are irrespirable. Carbonic acid is the characteristic gas, the physiological properties of which are well known. Carbon monoxide is produced by some powders, and this, even in small quantities, is an active poison. The danger incurred in going into a drift where a charge has been recently fired depends chiefly upon the ventilation. If the ventilation is poor the air in the drift is already impoverished. The oxygen is deficient, and the addition of even a small amount of irrespirable gas may turn the scale and make the air dangerous to life. This effect is more marked in mines at great elevation above the sea level because, owing to the lightness of the air, the amount of oxygen in the cubic foot is smaller than normal. Inspector Byrne says that he has strongly condemned the use of wooden boxes for thawing and has succeeded in many instances in securing the adoption of a hot water thawer instead.

The desirability of using brass plumb-bobs in surveying work was recently emphasized by the magnetic deflection of an iron bob, and the consequent introduction of considerable errors in some underground surveying recently undertaken. In plumb-ing a shaft about 400 feet deep with an iron plumb-bob it was found that the magnetism of a large number of old rails stored in one of the chambers

line was laid up the slope of a rocky mountain, at an angle of forty-five degrees.

The Lacy Manufacturing Company are the largest manufacturers of riveted steel pipe in southern California. They have made a specialty of heavy pipe for electric power companies, and have made and laid many miles of steel pipe for large irrigation enterprises in California.

Recent Additions to the Museum of the California State Mining Bureau.

Steatite—Five varieties of steatite; from A. W. Pray, Escondido, Cal.

Copper Ore (Chalcopryite)—Rich ore from the Blue Ledge, Joe creek, Siskiyou Co., Cal.; from L. F. Cooper, Crescent City, Cal.

Auriferous Vein Matter—Gneiss, hornblende, schist, with free gold, porphyrite, etc., and country rock, from the Golden Cross mine, Hedges, San Diego Co., Cal.; from C. A. Hamilton.

Dolomite—Curious dolomite formation from Morro creek, San Luis Obispo Co., Cal.; from Mrs. E. B. Richardson.

Sylvanite (Telluride of Gold) on Phonolite; Tetrahedrite in Barite, carrying 200 ounces silver per ton, and Uraninite (Oxide of Uranium)—All from Ph. Rearden, M. E., Denver, Colo.

Staurolite Shale—Believed to be the first staurolite crystals found in California; from Dr. J. F. Fargo, San Antonio, San Bernardino Co., Cal.

Bromyrite (Bromide of Silver)—Very rare; from Zacatecas, Mexico.

Guadalcazarite (Sulpho Selenide of Mercury and Zinc)—Very rare; from Guadalcazar, Mexico.

Gold Quartz (rich in free gold) and Nagyagite (Sulpho Telluride of Lead and Gold)—The first time this mineral has been noted in California; from Dorsleska mine, Union creek, Trinity Co., Cal.; from E. D. Lawrence. This is an interesting discovery. As other localities are reported from Coffee Creek district which are said to show telluride of gold, there may be an important telluride belt in that region.

HENRY S. DURDEN.

Pumping by Compressed Air.

The term "direct air pressure pump" is usually applied to that class of pumps in which the liquid is taken into an air-tight vessel and then driven out by the application of compressed air directly to the surface of the liquid. For instance, if the vessel *B*, Fig. 1, contains water, and air be forced in through the pipe *C*, the water will be driven out through the pipe *A*. The apparent simplicity of this operation and the absence of costly cylinders, pistons, rods,

valves, etc., has made it a popular subject with inventors. Several pumps involving this principle have been patented, a number of which have been tried practically, a few being now on the market.

To make the system self-operative, inventors have either introduced floats inside the tank *B*, or have made the tank *B* itself a float, the motion of these floats being made use of to automatically open and close a valve on the pipe *C* in such a way as to cause the tank *B* to charge and discharge itself regularly.

Difficulty also lies in the loss of power when the compressed air in *B*, after driving the water out of the vessel, is allowed to escape into the atmosphere, thus losing all the power that was required to compress the air. The percentage of this loss increases with the head against which the water is pumped,

FIG. 2.—PUMP APPLIED TO A SINGLE SOURCE WITH SINGLE LIFT.

and approximates 50 per cent when pumping to a height of 100 feet.

In a new system adopted by the Pneumatic Engi-

neering Co., 100 Broadway, New York City, these difficulties are overcome, for in it there are no floats and no air valves outside the engine room, and the air is not allowed to escape, being re-used again and again.

Fig. 2 shows how these conditions are attained. Assuming the compressor to be in operation with switch set as in the figure, the air will be drawn out of the right hand tank and forced into the left hand tank; and in so doing will draw water into the former and force it out of the latter, the charge of air in the system being so adjusted that when one is emptied the other is just filled, when at that moment the switch reverses the pipe conditions so that action in the tanks will be reversed.

The switch is placed on the air pipes near the compressor, where the engineer can see its operation and adjust it as needed. It can be automatically operated any one of three ways: First, by means of the suction, which occurs in the intake pipe to the compressor when water is drawn above its outside level in one of the tanks; second, by a mechanism that will throw the switch at some assigned number of strokes of the compressor; third, by an electrically controlled mechanism, the circuit being made and broken by a

PUMP APPLIED TO WELLS IN GROUPS.

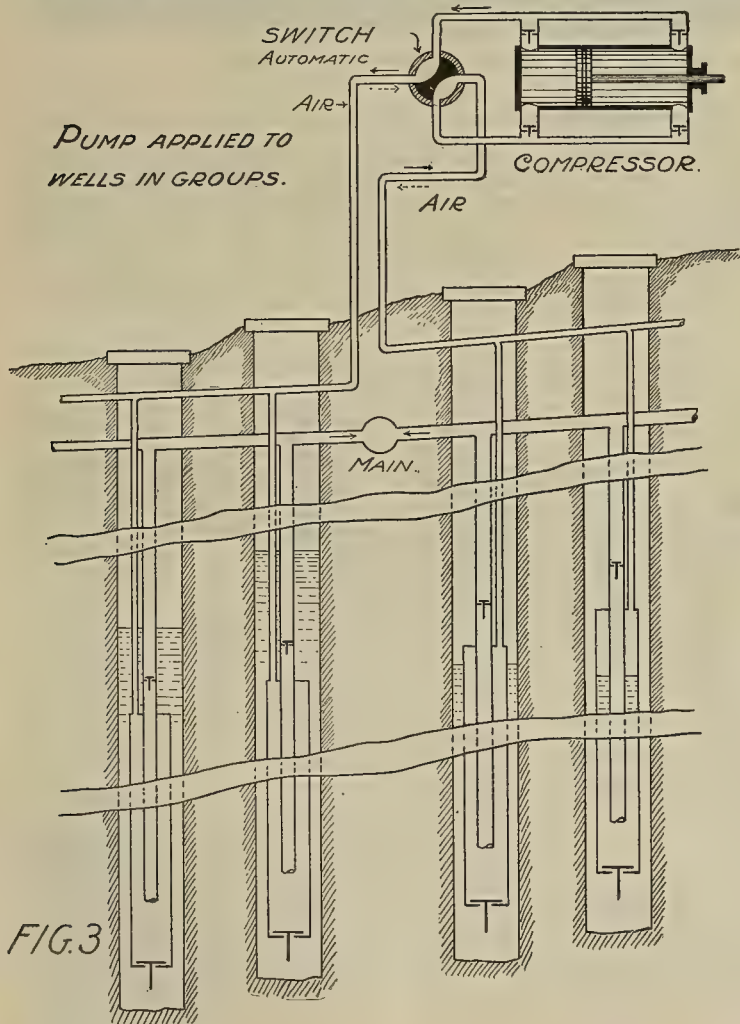

FIG. 3

FIG. 4

THE COMPOUND DIRECT-AIR-PRESSURE PUMP

(ADAPTED TO FIRE PROTECTION)

FIG. 5

FIG. 6 THE SYSTEM ASSEMBLED WITH RESERVOIR AND PUMP TANKS COMBINED IN T-T

pressure gauge on the intake to the compressor, or, if desired, by a float in one of the tanks.

The system's best advantages appear when the water is distant from the source of power, as in mines and wells, or where a power plant already installed desires to get water from some distant point or points. One compressor can pump from any number of places at the same time, and each point made to deliver according to its capacity, as is illustrated in Fig. 3. In the manner there shown all the wells in a village could be operated by a single compressor.

There can also be provided instantaneous high pressure service for fire protection by placing wherever desired two tanks, one containing air at high pressure, the other water. By opening a valve on a pipe connecting the tanks, the pressure of the confined air will be available throughout the water system. The proportion of tanks, arrangement of valves, etc., are details to be worked out for each plant. One such arrangement is shown in Fig. 4. In such cases the fire service tanks can be used as pump tanks, taking their water from low pressure mains and delivering it forward at a higher pressure. However, if these tanks are made large, the compressor need not be started except in case of prolonged fire.

Where elevated reservoirs, tanks or standpipes are not possible, or are not desired, the whole reservoir system can be placed underground, or in a basement, the pressure being supplied by tanks of compressed air in connection with tanks of water. An application for a patent is on file for such a system provided with automatic pressure-controlling devices and giving high pressure fire service when desired.

000,000 pounds. While the trade has steadily expanded, the prices have as steadily declined, despite the tariff.

British Mineral Production in 1897.

Official British statistics for 1897 just published show that the total value at the mines and works of the forty-three different minerals which the country has produced, was £72,043,801, as against £69,088,366 in 1896. The output of coal was 202,129,931 tons, the highest hitherto recorded. The *American Manufacturer* points out that the year 1897 is memorable from the fact that for the first time the output of coal in the Kingdom has gone beyond 200,000,000 tons; it exceeded that of the previous year by 6,768,671 tons. The quantity exported was no less than 37,000,000 tons, and is likewise the highest amount on record; the exports approach our entire output fifty years ago, and considerably exceed the output of any other country in the world except Germany and the United States. Bauxite shows a marked increase, while alum clay has dwindled to very insignificant proportions. Gold ore has increased in 1897, but shows a great falling off compared with 1894 and 1895. Lead ore and iron pyrites, after a heavy drop in the years just mentioned, seemed to have reached a settled production for the time being. Mica appears as a new comer with a total of 4983 tons in 1897. Manganese ore continues on the downward grade, the decrease in 1897 being nearly 50 per cent compared with 1896. Soapstone, after a blank for two years, was responsible for twenty-eight tons in 1897. Oil shale is lower. Petroleum stands unchanged. Phosphate of lime shows up a little bet-

"A New Mechanical Motion."

Natural incredulity results when "a new mechanical motion" is introduced to notice. As *Machinery* expresses it, there has been so much ingenuity expended on the transmission of power, that every possible method seems to have been discovered years ago. Sometimes one has to go back many years to find the original, but it is very seldom that the search is not successful. It is, therefore, with considerable misgiving that we call the device illustrated by the annexed engraving "a new mechanical motion."

VARIABLE SPEED BEVEL GEAR.

However, it certainly is new to many. As will be seen, it is a variable speed bevel gear, an elliptical bevel wheel driving a conical wheel, or vice versa. The salient feature, which renders the arrangement possible, is the shape of the pinion. It will be seen that on one side the teeth are carried further towards the intersecting point of the two cones, and that these extended teeth gear with the teeth on the short radius of the elliptical wheel. On the other hand, the short teeth on the pinion gear with the teeth on the long radius of the elliptical wheel. Intermediate between the long and the short teeth are others of graduated length to gear with corresponding teeth on the large wheel. The result of the arrangement is that while the small wheel makes two complete revolutions for each revolution of the large shaft, one of the wheels must run at a variable speed, the two extreme speeds being proportional to the longest and shortest radius of the elliptical wheel. The intention of the inventor is to apply the device to equalize the effort on the pedal over a considerable arc. The crank is applied to the axis of the large wheel; when the crank is descending, and the rider is able to exercise his full power, the large radius of the elliptical wheel is in action. When the crank gets on to the center the small radius revolves more quickly when near the center, and more slowly when in the best position for the rider to drive it. Hence, it is argued, the driver can use his muscles for a greater proportion of the period occupied by one rotation of the crank than if he had uniform gear.

Temperature of Battery Water.

With a free-milling gold ore (quartz), what degree of temperature of battery water effects the best amalgamation?

Spokane, Wash.

Between 60° and 70° F. has by some been considered the most satisfactory temperature, though other millmen claim that a temperature of even 80° F. insures the best results. The best thing on that subject that has recently appeared is a practical article on the "Temperature of Battery Water," on page 505, of the issue of Nov. 19, '98.

THE air brake was invented by Westinghouse, 1874; the torpedo by Bushnell, 1777; watch, by Peter Hele, 1477; thermometer, by Drebel, 1609; telescope, by Lippersheim, 1608; printing, by Gansfleisch, 1438; cotton gin, by Eli Whitney, 1793; microscope, by Jansen, 1590; lithography, by Senefelder, 1798; lightning rods, by Franklin, 1752; gunpowder, by Schwarz, 1320; balloon, by Montgolfier, 1783; barometer, by Torricelli, 1643.

A LARGE Pennsylvania tube company has spent \$100,000 in installing machinery for the operation of its entire plant by electricity. This is said to be the first large iron mill in this country to adopt electricity for power. A thousand H. P. will be distributed to about twenty-five motors of 40 H. P. each. The estimated saving in fuel will be 25 per cent.

PROPORTIONS FOR A COMPOUND DIRECT-AIR-PRESSURE PUMP.

REQUIREMENTS
LIFT 1000 GALS. PER MINUTE (~2.23 CU. FT. PER SEC.) THROUGH 500 FEET VERTICAL
LENGTH OF BOTH AIR PIPES AND OF WATER PIPE EACH BEING 600 FEET

PROPORTIONS

COMPRESSOR DISPLACEMENT, 9.5 CU. FT. PER SEC.
AIR PIPES 5 INCHES DIAMETER.
PUMP TANKS 816 CU. FT.
WATER PIPE 12" (MAY BE REDUCED TO 10" WITH BUT LITTLE LOSS).
TIME BETWEEN SWITCHINGS 360 SECONDS = 6 MINUTES.

FORMULA USED TO GET PRESSURE LOST IN FRICTION IN AIR PIPES.

$\beta = .000002 \frac{1}{2} V^2 R$
 β = PRESSURE LOST IN POUNDS PER 39 INCH
 l = LENGTH OF AIR PIPE IN FEET.
 d = DIAMETER OF AIR PIPE IN INCHES
 V = VELOCITY IN FEET PER SEC.

R = RATIO OF COMPRESSION RELATIVE TO ATMOSPHERE.

The store of compressed air will keep up pressure in the system while the compressor is idle at night or otherwise.

The general arrangement of such a system is shown in Fig. 5 and in Fig. 6.

Where it is necessary to pump sewage or corrosive liquids the absence of delicate and nicely fitting parts in contact with the liquid, and also the absence of need of frequent inspection, is believed by the manufacturers to render this system peculiarly suitable. The pumping engine is in this system replaced by two plain strong tanks with no movable parts except the inlet and outlet water valves. These tanks need no attention and may be set above water or submerged as desired.

The system as designed uses to the greatest possible degree the energy stored in compressed air, when the work of expulsion of water from one tank is done the compressed air remaining in that tank being transferred by the compressor to the other tank without loss of expansive energy.

In mine pumps no delicate or costly machinery goes under ground, effecting saving in first cost and in attendance and repairs.

Plate No. 7 presents a graphical study of an assumed proposition in which the loss is 15.4 per cent from all sources.

This is a matter of general interest to engineers, mine owners, superintendents and others handling large quantities of water where the power is distant from the supply.

WIRE NAILS have only been in common use for sixteen years, but in that time they have conquered the foreign as well as the domestic market. The output for 1897, as appears by the Treasury statistics just printed, reached the enormous total of nearly 900,

ter than in 1894 and 1895, but the total is only estimated, and even then pales before the figures in the special table of imports. The Falls of Foyers is still the only place where aluminum is produced. No plumbago, antimony ore, potassium, or quicksilver was produced last year. The imports of the latter article were 4,105,053 pounds, against 3,536,928 pounds in 1896. Sodium is now only produced at Oldbury, the amount for 1897 being about eighty-five tons, valued at £12,750. Strontium sulphate has declined somewhat, but still the total far exceeds that of the six preceding years. The output of iron ore increased from 13,700,764 tons in 1896 to 13,787,878 tons in 1897, the product of the latter year being valued at £3,217,795. The value of the coal output was £59,740,009, or about 80 per cent of the total, iron ore being second, and representing but 5 per cent of the value of the total mineral production. Bauxite was produced in Ireland to the amount of 7249 tons, valued at the pits at £1918, and yielding a total of 310 tons of aluminum metal. As the home production of manganese ore was small in 1897, only 599 tons, nearly all the ore used in Great Britain has to be imported. The imports last year amounted 159,982 tons, or about 3000 tons more than in 1896. Fully one-third was imported from Russia, the other third from Turkey and Chili, and the balance from other countries, leading among which were British India, Brazil, Spain and Greece.

THE electrical building of the Paris Exposition of 1900 will contain machinery for lighting the entire grounds, which requires engines of over 12,000 H. P. This will require an immense amount of water for the generation of steam, and it has been decided to utilize this water in a great electrical fountain 100 feet high before delivering it to the boilers.

Records of Mine Work.

Inquiry as to convenient forms for record blanks for mine work shows the growing realization of the value of such records. Herewith are presented a few that have been found to satisfactorily fill daily requirements. It is manifest that no form that could be published would fill all individual requirements. It is believed, however, that any one desirous of keeping a record of such things will find in any or all of these a few general points that permit of adoption in his individual case. The utility and value of such

records are not here made the subject of any argument. Many will consider the whole idea "too much bother and expense," or "not worth the trouble." A still greater number think differently, and they rank among the most successful miners—"success" in this case meaning resultant profit from the mining work.

The blanks printed are copies of those in use, and while they are manifestly from a comparatively large concern, they contain little practical details that might with advantage be observed by many smaller mining enterprises.

Blank No. 1 is designed as a record of progress and costs in mine or mill work in either shaft or tunnel. Each line filled out under the several headings would be the summary of one week's work. In this case the actual figures on the blank obtained for reproduction are given for the first week of the record.

Blank No. 2 is self-explanatory, being the weekly report and expense account of the foreman.

No. 3 is the shift report of a crew in charge of machine drills in drifting.

Nos. 4 and 5 are also of convenient form.

Mining Summary.

ARIZONA.

Shirley & Treadwell are developing the Oliff properties in the Black Hills. J. McGregor made a shipment of ore from the Yellow Ned mine last week which returned nine ounces gold and 146 ounces silver to the ton.

The Septazuma M. Co., near Geronimo, is installing a big smelting plant. Fourteen carloads of machinery arrived recently. At Prescott, Thompson & Rowe had sixteen tons of ore run through the Silver Flake mill with satisfactory results. J. Chambers had a lot run through the same mill yielding \$40 per ton gold. High grade gold ore is reported to have been discovered on the black point at Cerbat. Qualey Bros. continue shipping ore from their claims in the Lone Star district near Graham. Another discovery of high-grade ore is reported in the Commonwealth mine at Pearce. The Hardy mine, in the Whetstone mountains, made a shipment of 1000 sacks of high-grade copper ore. The ledge cut by the tunnel at 150 feet is 17 feet thick, yielding copper ore which averages 17 per cent in metal the entire width.

The Stockton Hill mines, near Kingman, are again being opened up. The old Crook mine in Yavapai county is to have a stamp mill. Lyons' new stamp mill on the Hasayampa is about completed. Near White Hills, C. Latin and partners have struck placer ground, which they are working with dry washers. The Azurite, Pima county, is working twenty-five men. It will be ready to blow in the furnace as soon as coke arrives. The shaft in the Mammoth mine is being sunk an additional 100 feet; this will make it 700 feet deep. At 600 feet the vein is 40 feet wide. The United Globe smelter is temporarily shut down for want of coke. The Tennessee fifty-ton concentrator is expected soon to turn out a carload of concentrates daily. The Old Dominion Copper Co. is accumulating a large quantity of copper at the smelter. There will probably be 2,000,000 pounds for shipment when the railroad switch is completed.

The Ajo copper mines in Yuma county have passed to Eastern capitalists, who are doing extensive development work. C. F. Hine is operating the Live Dog mine in Yuma county and is said to be taking out good ore.

It is locally reported that the Saginaw mines and works, near Tucson, will start up again soon. Development in the Santa Maria mine at Arivaca is showing high-grade mineral. The Nelson copper smelter of Silver Belt is outputting three tons of matte a day. The Mammoth G. Co. has 100 men employed in the mines and at the mill. The Azurite is working twenty-five men and will blow in shortly.

Yuma Sun: Stein & Broderick, who own the wolframite properties at Russellville, are employing sixty-five men. M. Canna, who also owns some properties in the district, has twenty men at work. A quantity of ore has already been shipped. Work has resumed, with thirty men, on the Ray copper mines, Mineral Creek district, Gila county, a bond on which was secured some time ago by an English company, the provisions of the bond being the payment of \$100,000 at the end of the first year and a like amount in two years. The Klondyke mine in Casa Grande district, Pinal county, owned by J. Bauerlan, carries gold, copper and silver. There is a large body of ore which yields \$30 per ton, and with a reduction plant, could be profitably worked. After eighteen months of working in the Wizard mine, in Big Bug district, Yavapai county, was found a pay streak 2 feet wide, carrying \$40 in gold per ton. The Chicago M. & M. Co. is working the gravel deposits of Walnut Grove district, Yavapai county, by the steam shovel process, and is meeting with success. The World's Fair mine, in the Harshaw mountains, recently shipped a car of ore which went 1800 ounces in silver to the ton.

Globe Times: At the Ray copper mines near Globe the new operators have cleaned out and timbered the 100-foot shaft of the Poorman claim and sunk it 50 feet deeper. In the Ray claim the shafts have been cleaned out and retimbered. Work will be continued on both claims, by contract. The Mammoth gold mine near Tucson is being sunk 100 feet deeper. From the 200 level the ore body has been large but low grade. At the 400-foot level the ore measured 60 feet. The average width has been 40 feet. When the projected 100 feet deeper is finished the shaft will be 700 feet. The water for the engines at the mine is brought up in the returning ore buckets. The mill is handling 150 tons per day over their two and three-fourths miles of bucket line. The cyanide plant at the mill has been in operation for six months on the estimated dump of 150,000 tons. The Mohawk Co. is operating on an extension of the Mammoth mine with a 30-stamp mill located on the mine and furnished water through a pipe line. The Washington Camp country has shipped ores from Crittenden for twenty years. The ores are a sulphide copper of a high grade, carrying silver, a little gold and a large percentage of zinc. Bartlett & Crowe have run concentrators on the Holland and other ores for two years, shipping the product to the smelting works. The Oro G. M. Co. of Oro Blanco district, close to the Sonora line, is sinking and continues to look well. A mill is contemplated.

Tombstone Epitaph: The Loudon and Galen mines in the Whetstone mountains are shipping 1000 sacks of high-grade copper ore. The ledge cut by the tunnel at 150 feet has been passed, being 17 feet thick, yielding copper ore which averages 17 per cent.

Phoenix Republican: The Zonia M. Co. is operating near Kirkland. They have bought and bonded twenty claims and are grading for a smelter and hoist. The Plomosa No. 1 and No. 2, near Yarnell, have a shaft down 100 feet and 150 feet of drift on a ledge 5 feet

wide that is said to average \$10 per ton in gold.

CALIFORNIA.

Amador.

Jackson Dispatch: At the Lincoln mine, Sutter Creek, the shaft is down 500 feet and work is progressing; ore is being taken out at the 100-foot station. At the Mahoney shaft Supt. Ross is sinking 100 feet from the 1000-foot level and at the same time taking out ore enough to keep the 40-stamp mill running night and day. The Wildman shaft is being repaired, in consequence of which only twenty stamps are dropping. The Emerson shaft is down 350 feet and is still in greenstone. This shaft will strike the Wildman vein at a depth of 3000 feet perpendicularly, and through it most of the work will be done when it reaches the intended depth. At the Potazuba they are hauling ore to the Bailoi mill and will crush about 175 tons. The Potazuba is owned mostly by local people. At the Bailoi twenty stamps are dropping on rock from the 200-foot level which is paying well.

Jackson Republican: The Bay State mill near Plymouth is running about ten stamps. The miners are stopping and will continue so for some time. The Keystone mine at Amador City is being worked with a full force. The mill is running all the stamps. The Monarch mine near Nashville is doing extensive development work. At the South Spring Hill, Amador City, five stamps are used to crush rock from the Median mine. The cleaning up of the Empire dump is in progress day and night.

Jackson Ledger: D. Fisher, who prospected the Spagnoli mine near Clinton, which he and his associates recently bought, has concluded that the property is of sufficient value to justify extensive operations. They will sink a shaft and construct a mill. The Picochontas mill at Drytown will be ready to run as soon as water comes. At the Centennial mine at Drytown the water is being kept out of the shaft. The vertical shaft at the Kennedy mine is well under way. The collar is in the neighborhood of 50 feet lower than those of the other shafts. The shaft is to include three compartments, each of which is 4.2x5 in the clear, making an excavation 16.8x 7.3. The plant to be installed will handle all the work for a year or more, during which time the management of the property will reach a decision as to which manner of power to provide for in their permanent works. The ledge which the Kennedy people are intending to open up by this shaft is one they are now mining in their old shafts and which, if it retains its present course, will be in the new shaft at about 3100 feet depth.

Calaveras.

San Andreas Citizen: Work on the Howard mine, near Milton, is progressing. A contract has been let to sink 250 feet. At the Lost Log mine there are ten men employed. The shaft has been sunk 150 feet, where the vein shows well. Since June last the Somersville Bros., operating the Somersville river bed gravel mine, near Vallecito, have realized \$6000 and have had from eight to ten men employed. Work has been suspended for the winter. At Angels the Utica and the Stickles mills are in operation and the sixty stamps of each mill are dropping day and night. The Lighter mill is running twenty stamps. Fully 1000 men are employed at the several mines at Angels, the Utica alone working 400. At the Big Bonanza mine Supt. Blackhart is pushing development work. At the Fox mine an electric motor and steam hoist will be installed.

El Dorado.

The Boulder M. Co. have forty men enlarging their ditch. J. H. Skinner, on Quartz Hill, struck high-grade quartz recently at a depth of 110 feet.

Placerville Nugget: The 10 stamp mill at the gravel mine at Grizzly Flat shut down on account of the freeze. The Eagle King mine is running night and day.

Placerville Democrat: Titcomb Bros. & Selby of San Francisco began operations on the Harville hydraulic mine near Diamond this week. F. Thomas & Co. will build a 5-stamp mill on their quartz mine near Gold Hill. At Kelsey, after having been closed down for several years, the 20-stamp mill at the Gopher-Boulder, including the electric plant, was started up last week. The new mill of the Griffith Con. mine, near Diamond, together with the electric appliances, concentrators, ore crushers, etc., were started up last week and are working successfully. The head of water is 1012 feet, delivered to a Pelton wheel, which runs at a speed of 450 revolutions a minute and is directly connected with a 250 K. W. Westinghouse generator, giving 333 H. P. The line of transmission is four and one-half miles, the electric pressure being raised to 10,000 volts. It operates an alternating current hoist motor capable of raising 5000 pounds 600 feet a minute. Croft & O'Brien have tapped the ledge in their Independence mine, near Slate mountain, at a depth of 130 feet; it is of good grade. Supt. Moore has men to work on the Lucky Marion mine near Greenwood.

Kern.

Near Tehachapi the Big Horn Co. is putting in a 2-stamp mill to be run by water power; it will do its own work in addition to custom milling. There are about twenty-five men in the camp. The Matthews quartz mill is being built in Mojave. It will have a capacity of twenty-five tons per day. G. Otterman has one claim at Bearville from which he has taken considerable ore, which is reduced with an arrastra. H. Vincent Wallace of Bakersfield, will erect a 2-stamp mill at Bearville.

Los Angeles Mining Review: At Randsburg the Yellow Aster Co.'s engine and pump at the wells were started last week and in a few hours the pipe was discharging a heavy flow of water at the mill site on Rand mountain, six miles distant. It is expected that before Jan. 15th the mill will begin operation

and thirty stamps be dropping on Rand ore. The company now employs 140 men. The output of the mines for December will be fifty tons per day and the product will probably equal that of November, which was about \$70,000. The Little Butte the past week added \$2000 to its treasury. Meade Bros., Stamm & Bacon have bought the Cuddeback tailings dump, approximating 5000 tons, and will soon begin the erection of a 30-ton cyanide plant. The tailings are said to be fairly rich.

The Eureka mill people have been successful with their cyanide plant and in a short time will do custom work with it. Cyanide treatment seems to work successfully with most of the ores of this camp. Reports of good strikes last week come from the Standard mines, near the Little Butte, and the Chase-Crenshaw claim, south of the Rand. Benson Bros., on one of their claims near Val Verde, opened a body of good shipping ore.

From the Ruby and Alpha claims near Johannesburg good ore is being extracted. The dry concentrator at the Hard Cash mine was started last week and is working satisfactorily.

Randsburg Miner: The Red Dog mill made a crushing of ten tons of ore from the Kustron mine. The same mill ran sixty tons of ore from the Butte and cleaned up over \$100 a ton. In the Windy mine near Johannesburg a new strike was made that will go \$400 a ton.

Mariposa.

The Mt. Gaines mine will be the first in Mariposa county to use electricity as a power to crush quartz. The Gazette notes that the Merced river is in a natural position to furnish power for the mines on each side of it.

Mono.

A strike of gold ore has been made in Antelope valley by J. E. Carter, and he has done sufficient work to show that it is a promising property. A. B. Lemmon of Santa Rosa is interested. They have eleven men at work.

The frame for the new mill building is up at the Standard Con. mine at Bodie. The battery frame will be completed by Jan. 1, '99. An addition of one wire to the pole line has been finished for four miles. At tailings plant No. 1, 361 tons of tailings were treated during the week. The November product of the tailings was \$5400.

Nevada.

Near Nevada City the water from the Spanish mine will be used for power at the Champion mine, and a pipe line is being laid to convey it from the former to the latter mine, a distance of several miles.

Progress is being made at the Gaston Ridge mine near Graniteville, and the new air compressor started this week. The mill is running steadily on good ore.

Grass Valley Union: Williamson & Co. are doing considerable development work at the Giant King mine, near Washington.

Telegraph: The completion of the new plant at the Empire mine at Grass Valley is to be celebrated Dec. 28. The Empire is the oldest working mine in the State.

Nevada City Transcript: Arrangements will probably be completed soon for resuming development on the Columbus drift mine near Nevada City. Work was discontinued on the property upon the death recently of C. Waterhouse.

Placer.

A force at Shady Run is building a large reservoir for the quartz mill company.

Riverside.

At the Gavilan mine this week a gold nugget worth several hundred dollars is reported to have been found on the 500-foot level.

The Gavilan mine near Perris is down 300 feet and lately a good vein on the lowest level has been uncovered. This ore is having a separate milling. The vein is 18 inches wide. There are thirty men employed. After Jan. 1st the mine will be sunk deeper. The Santa Rosa mine, which has been idle for nearly two years, will, it is said, resume operations. The cyanide plant on the Santa Rosa tailings is giving returns of \$2000 a month. The Good Hope mine is being run by leasers. Some of them are doing well. George & Johnson, two leasers, made a run of sixteen tons of ore which netted \$24 a ton. Cheatham & Tipton, controllers of the Good Hope cyanide plant, are producing good results. I. N. Boicourt has a claim near the Good Hope which he will soon cyanide on a large scale. J. B. Dennis has started his mill on ore from one of his properties near the Santa Rosa mine. The Pilot mine near Cotton is crushing rock worth \$50 a ton. The Chuckawalla Co. will put in a milling plant.

Sacramento.

The Mississippi Bar mine near Folsom will be operated by W. P. Bonbright & Co. of Colorado, who have secured title to the property, and the contract for the construction of the dredger has been let to the Risdon Iron Works. The machinery will be ready to be placed as soon as the carpenters finish their work. Fifteen men will be employed on the dredger.

San Bernardino.

Near Vanderbilt the St. George mine, which had been long abandoned, has developed under its new management into a producing mine. The Bronze is also producing, and some late discoveries have been made on the Hong Kong group which prove it to be a meritorious property.

Shasta.

Redding Free Press: Twenty-five thousand pounds of sulphurets from the National mine were shipped from Redding last week to the smelter. McKinnon & Henderson sold to A. R. Parsons of San Francisco and associates the Bacchus quartz mine in Dog Creek mining district for \$2000.

Shasta Courier: The Penrose claims near Shasta have been sold to J. H. Roberts and others. It is understood that Capt. Roberts will do extensive development on the White Oak. J. Herron of Redding, will soon begin

working his mine near Shasta, and will crush the ore with an arrastra.

Sierra.

The Los Angeles company that have a bond on the Kenton mine near Alleghany struck the ledge recently. It is reported that the ledge is 8 feet wide and of good grade. This company has been running for the ledge all summer and have expended nearly \$25,000.

Grass Valley Union: Another good strike is reported made in the York mine at Downville recently. The property has been yielding well the past year. A mill was recently erected, which is running steadily. Last week a new strike was made in the Mountain mine at Sierra City which is said to be a good grade of ore.

The Dewey Gravel M. Co., composed mostly of Grass Valley people will prospect an extensive property near Forrest. Work will begin immediately.

F. B. Hill, Supt. Oriental mine near Alleghany, expects to have the mine clear of water by Jan. 1st. The shaft is 280 feet deep; when the mine is unwatered, sinking will begin.

Siskiyou.

Yreka Journal: McCaw & Co. are building a quartz mill at Patterson creek. They bought the mine from Fry & Macaulay for \$35,000. The ledge is about 30 feet in width and mills from \$80 to \$100 per ton. The new quartz mill at the Schroeder mine on Deadwood will be ready to start up soon on ore taken out the past two years. W. N. Dale has bonded his mine near Yreka to people who will begin extensive operations next spring. Milliken & Barry of Fort Jones bought the old Jesse Franklin quartz mine, on Rattlesnake creek, in which they find good prospects. Ironsides & Wadsworth are prospecting the Gaffney mine, near Fort Jones. The Greenhorn blue gravel mine is yielding good returns, notwithstanding the scarcity of water. The company consumes 110 cords of wood a month for raising the bedrock water used in sluicing.

Trinity.

The Weaverville Journal says that a San Francisco company has bought the Paulsen gravel properties on Trinity river. The papers are being passed upon by the attorneys of the San Francisco company, and as soon as approved the sale will be closed and the company take possession. A representative of the company will arrive shortly to ascertain the amount of pipe, lumber, labor, etc., required to thoroughly equip the same. The properties are between Lowden Ranch and Douglas City and contain about 1400 acres.

Tuolumne.

At the Santa Ysabel mine, at Quartz, the ore body lately struck at the 400-foot level was from 6 to 8 feet thick when first entered and it is growing thicker as drifting proceeds. The shaft is down 550 feet and an entrance made at the 500 level.

Sonora Democrat: In the Mt. Jefferson mine near Groveland twenty men are employed. The shaft is down 200 feet. The vein returns from \$8 to \$10 per ton. The 10-stamp mill is soon to be supplanted by a new plant. The new hoist and pump are working satisfactorily. The Mt. Jefferson has been idle for many years. The vein averages 8 feet in width. It is owned by a Boston company.

In the Big Oak Flat mine one shaft is down 150 feet and another 50 feet. The vein is from 4 to 6 feet wide and mills \$15 per ton, besides concentrates. There is a 5-stamp mill with a crushing capacity of twelve tons each twenty-four hours, but ten new stamps are soon to be added. The mine is under bond to the Tuolumne M. L. M. & D. Co. At the Longfellow mine near Groveland a force was this week put in the new shaft and three shifts will be kept at work until it is 300 feet deeper. The present depth of the shaft is 295 feet. The shaft is being driven in the vein and at 120 feet crosscutting showed 30 feet of quartz. Milling tests yield \$3.30 per ton. The mill is run by steam, from six to eight cords of wood being consumed daily, while battery water is pumped from the mine. The property was opened forty-five years ago, but never went deeper than 90 feet. The Mack mine is bonded to an Oakland company who are pushing development work. The mine has a 6-foot vein of low-grade quartz, but with frequent pockets keeps the cleanups up to a good average. The shaft is down 212 feet. The Mack is equipped with a steam hoist and pumping plant and a mill is among the early possibilities. The Carlotta is being unwatered. Work on the Uncle Sam at Araratville is confined to sinking the shaft. A 90-foot tunnel has been run on the Red Jacket and shows a good prospect. The Kanaka is putting in a new air compressor. The Mississippi and Abbie L. are bringing out good ore. Drifting on the vein continues in the Donella. Richards & Wetmore have secured a bond on a gravel claim at Mountain Brown. The Blue Lizard has been bonded by Alameda people and sinking has begun. On the Tough Nut the tunnel is in 100 feet and milling ore has been found. Work on the Big Oak Flat ditch is progressing. From this the mining district to be benefited will have practically unlimited water for mill and power purposes. Williams & Nichols on the Lily and Gertrude claims are getting out good ore. Their arrastra will be started as soon as the rains increase the water supply. N. Screech, who operates a quartz mine on the Middle Fork of the Tuolumne, has made a cleanup from his arrastra which gave an average of \$30 per ton. The Mexican M. Co. are erecting a hoist and pumping plant. The Stockton Gravel M. Co. has 150 men at work on the new ditch to convey water to the Philadelphia placer diggings.

Sonora Independent: High-grade rock has been struck in the Purdy vein of the Hazel Dell group of mines near Soulsbyville. There are six mines in this group and the properties are operated by the Jubilee M. Co. Work is progressing with power drills and air compressor. The Mt. Lily mine is taking out good ore. At the Black Oak mine ten more

stamps will be put in as quickly as possible, making a total of thirty.

Jamestown Magnet: The McCormick mine near Stent is working six miners. The machinery for the Columbia Expl. and Tunnel Co. is being placed in position and boring for gravel will begin on the Bannister claim near Jamestown. The machinery will be driven by steam. Developments are being made by a San Francisco company on a gravel claim near Springfield Flat. They have a large body of good gravel which prospects well. At Columbia work on the Hope continues. The Philadelphia Gravel Co. are pushing their ditch to completion. A company has begun work on a large scale on a gravel deposit on the Stanislaus river near Pine Log. Holmes Bros. have opened a small vein near Columbia which prospects well. Ball & Stone have leased the Hudson & Calhoun mine at Saw Mill Flat and will begin operations on an extensive scale immediately. Abell & Co. are opening their gravel mine near Crystal Cave. An ore chute has been found on the Jim Budd mine at American Camp. The vein is 220 inches wide. The Jubilee M. Co., operating the Hazel Dell group of mines, have opened a body of good ore.

COLORADO.

BOULDER COUNTY.

In the Victoria mine at Summerville an 18-inch vein of four-ounce ore has been discovered; an 8-inch streak shows ten ounces to the ton.

CLEAR CREEK COUNTY.

Near Empire the tunnel of the Bellevue-Rochester Tunnel Co., composed principally of people interested in the Bellevue-Hudson mine, is to be driven by an air compressor. The objective point of the operation is the Bellevue vein, which will be tapped 200 feet below the present workings or 300 feet below the surface. The portal of the tunnel is directly at the base of the mountain, and with in easy reach of the Colorado Central tracks. A change in the values of the mine from silver-lead to gold, running in some instances as high as three ounces to the ton, is said to have determined the owners to begin a work that will cut several other veins. With many of the deeper shafts water is becoming a serious problem, whose solution this bore will render easy. The Bellevue was a large shipper before the decline in silver. Three shifts are retimbering the drift in the Conqueror mine, closed against the lessees by order of Mine Inspector Nye. A body of high-grade concentrating material remains in the stope. The arrival of the heavy machinery for the Forrest City Co. will enable it to sink the deep shaft on the Empire City lode. Cleveland capital is backing the enterprise. The Gold Dirt Co. on Silver mountain is running on the tribute system. There is awaiting shipment over 500 tons of high-grade milling stuff. The output will be increased as soon as additional mill service can be supplied by water conveyance. McDonald & Trevillion realized \$75 per ton from two carloads, and Wolcott & Co. and Mitchell & Cutting are breaking ore of like quality in adjoining ground.

Idaho Springs Gazette: The Mammoth tunnel, near Idaho Springs, is working twelve men. It is in 1000 feet. The Perkins Con. G. M. Co. has twenty-eight claims and is running a crosscut which will cut some of the veins at a depth of 2000 feet. The tunnel is in 700 feet. A vein 18 feet wide was cut recently which went \$30 per ton. The Champion made a shipment of copper ore. The Joe Reynolds is shipping first-class ore by the carload. It is found at a depth of 800 feet.

DOUGLAS COUNTY.

Near Rico the Black Hawk mine, a lead property, carrying some silver and gold, is a regular shipper. The Alleghany and the Swansea are shipping several carloads a month.

EAGLE COUNTY.

From Red Cliff the Ground Hog mine is shipping small lots of high-grade ore to the home smelters.

EL PASO COUNTY.

At Victor the Victor-Colorado tunnel has reached 2127 feet. Twelve tons of \$60 ore was sent out from the Hankey & Cole lease last week. Miller & Gray sent out fifteen tons of \$15 and \$25 ore from their lease on the Pharmacist. The Raven Co. and lessees shipped 140 tons of ore last week, of which one-half was smelting grade. Vein No. 25, which was recently cut in the Mogul mine, Cripple Creek, runs two ounces in gold to the ton. The tunnel is in 750 feet. Through this tunnel five companies will be working their properties Jan. 1st. Fifty tons of ore taken from the Trachyte will run \$50 and \$70 to the ton.

Victor Record: The Orpha May of the Union Co. at Victor produced 800 tons of ore in November with a gross bullion value of about \$15,000. The production of the Deadwood last week amounted to forty tons of 3-ounce ore, and a like shipment was made this week.

The Portland G. M. Co. will this month begin a system of development work that will eclipse all past records of production on this property. Work is temporarily suspended on the Last Dollar until January, to put cages in the shaft. The ore output for November consisted of four cars of smelting grade ore and twenty-four cars of second grade shipped to the cyanide plants. The plans for the Gold Coin mill at Cripple Creek will be in Denver during the coming week. The company has decided to build a mill with a capacity of 300 tons per day, but will so arrange the machinery that a duplicate mill can be erected when considered necessary. The crushing machinery and power will be of the full capacity for the treatment of 600 tons per day.

HINDSdale COUNTY.

A shipment of 16,100 pounds of ore from the Wyoming mine, Engineer mountain, netted \$1585. The mine is operated under a lease.

LAKE COUNTY.

Leadville Miner: The May Queen Leasing

Co., working the Ground Hog mine on Battle mountain, has two cars of ore on the track for shipment to the Pueblo Smelting & Refining Co., which will average \$14,000 per car. The shipment is in charge of armed men. Mgr. J. S. Doddridge is mining the metallic gold. He keeps the stopes guarded. The Garden City mine, worked under lease by Rainey & Murphy, is shipping a small amount of iron each month, which carries from three to six ounces silver and a good excess. The lease on the property of the Seneca M. Co., worked through the Ponsardin shaft on Yankee hill, has been worked for the past five years at a cost of \$20,000, and has opened a large body of low-grade zinc sulphide ore which carries 8 to 10 ounces silver, 8 per cent lead and .06 of an ounce gold, also zinc to the amount of 12 per cent. The Ballard output amounts to twenty tons daily. This ore nets \$35 per ton according to settlement sheets.

The production of gold ore from the Ibox mines for November was above 8000 tons. The payroll carried 506 names. The output from the Mab mines, Leadville, last month was taken by five different smelters and amounted to 4000 tons of lead sulphides. The chute has been proven 200 feet wide. The payroll carries sixty names. The Penn mines are shipping 100 tons of gold quartz to the smelters every day, and have twenty stamps at work on the mill dirt.

OURAY COUNTY.

Ouray Herald: It is stated that with the opening of spring the electric power plant for the Meldrum tunnel will be built. The water wheels will have a head of 1000 feet. This power will furnish force for driving the tunnel from the Ouray side and when completed run the drills and cars.

PARK COUNTY.

At Alma the Orphan Boy mine is shipping ten to twenty cars of ore per month. The mine employs fifteen men. The ore is hauled three miles by wagon to the railroad.

SAN MIGUEL COUNTY.

Telluride Examiner: The South Park mine, near Telluride, is developing a vein that carries 4 feet of galena with a value of seventy ounces in silver, \$2 in gold and 21 per cent lead.

Telluride Journal: The Pennsylvania tunnel, on the Smuggler-Union, has reached 2100 feet, with 2000 feet yet to run to intersect the Union shaft. Thirty men are employed in the copper mines at La Sal, and nine freight outfits are hauling high-grade ore to Placerville for shipment. The lower grade awaits the completion of the smelter. The Hydraulic Co. have recently put twenty-five men at work on their mines near Paradox. The Hector M. Co. is equipping its mill at the Cimarron with a new engine, which weighs over 40,000 pounds. It will be packed over the mountain trails. The flywheel is in two pieces, each weighing 5500 pounds.

IDAHO.

The Twin Springs M. Co. of Idaho, which has recently purchased the Deer Lodge mines for \$100,000, of which sum \$15,000 was paid down, has closed a contract for a 40-stamp mill.

Near Wallace, on Sunset peak, a region neglected for want of transportation facilities, W. A. Clark has begun on a tunnel running under the peak, which, when done, will be 2500 feet long and cost \$50,000. Without much spent in development, but working on the ore in sight, the Consolidated Tiger and Poorman M. Co. has paid off the indebtedness incurred through the destruction of its mills two years ago and has begun paying dividends again. The shaft is below the 1500-foot level, practically 1900 feet, that being the depth below the highest workings above the mill.

The Huntington Herald is informed that the Northwest Railway Co. has secured an option on Kleinschmidt's nine-sixteenths in the Peacock mine at Helena. Seven Devils district, for \$900,000, and it is said the company has paid ex-Gov. Hauser and associates \$200,000 on account for the balance of their interests in mines at Helena.

Albion, Idaho, Times: F. & J. Langford made a shipment to Salt Lake of ten tons of Melcher ore to find out what method will work the ore to advantage. There are four men at work in the shaft on this property, and are taking out some good ore. If the test proves satisfactory machinery will at once be introduced to handle the water which is now bothersome, and the mine will be worked to depth. Ore is being shipped from the Pritchard creek group of mines near Murray. A carload of ore from the Copper Queen mine near Lemhi went \$16 a ton in gold, five and one-half ounces silver and 27 per cent copper.

The Boise Statesman is informed that the dredge that has been in operation near Warm Springs yielded \$240 a day net. The mill on the Twin Sisters mine near Centerville has closed for the winter, after making an experimental run, which was satisfactory. The company was not prepared to run during the winter and will devote the time to opening up the mine.

Idaho City World: The Bunker Hill & Sullivan's Kellogg tunnel is in over a mile and is adding 12 feet a day. No very hard rock has been encountered, nor has there been any sign of mineral wealth. A dredge will be built this winter and put in operation next spring to work the placer mines at Stanley Basin. On Moose creek, in Lemhi county, they have a dredge of a capacity of 5000 cubic yards a day that saves 98 to 99 per cent of the gold. Freight teams loaded with mining supplies left Baker City, Oregon, last week, for Cuprum, over the Seven Devils wagon road, carrying 14,000 pounds for the Northwest Copper Co.

MONTANA.

The Thompson Investment Co. last week secured a controlling interest in the Sunrise mine, near Phillipsburg, by securing 265,000 shares of the stock under execution, in the

suit of the Merchants' and Miners' Bank of Phillipsburg against Sherman & Durfee, for \$25,000. The Sunrise property has not been worked for a year. There is said to be a vein 8 feet in width which, according to assays recently made, carries \$7.40 in gold to the ton. There goes with the property a 20-stamp mill. Work will soon begin on the property. The Florence mine at Neihart is operated steadily and high-grade ore is shipped.

J. R. Bordeaux, with Butte men, operating the Ella claim in Meaderville, at a depth of 300 feet uncovered a body of ore 2 feet in width which assays \$283 in silver and 3 per cent copper. About \$20,000 worth of ore has been taken from the Ella. Development will continue to the 400 level.

Near Basin work is pushed on the Katy mill and the smelter is nearing completion. When it is finished electricity will be used as the motive power and also for lighting the lower workings of the mine. The stockholders of this property have recently increased the capital stock from \$600,000 to \$1,000,000.

Clancy Miner: From Jefferson county, in the First Shot, Lyons & Sherlock shipped 700 pounds of ore that netted \$1160. From samples of a new strike they received twenty ounces in gold, 1194 ounces in silver, 65.4 per cent lead, a trace of copper. The lead is wide and the streak from which the samples were taken runs a foot in width. The First Shot is about three miles north of the Eva May mine, the property of the Basin & Bay State M. Co., which for years has been a good property, but of low grade ore.

Butte Intermountain: The Washoe Copper Co. has seventy-five men driving a tunnel into Silver lake to tap it. The Washoe Co. has let the contract for the driving of a tunnel 4000 feet long that will tap the lake 30 feet below the water's surface. It is said that the intention is to use the lake reservoir in the spring, raising the water above its level by means of a dam. The property of the Mammoth G. M. Co. at Coloma will be sold at sheriff's sale on Dec. 30th. The claims against the company are held by S. E. Larabee of Deer Lodge, \$7320.47; W. B. Hosmer of Boston, \$17,000; Missoula Mercantile Co. of Missoula, \$2300. An engineer and pumpman are keeping the water out of the mine and a watchman at the mine and mill are retained.

Basin Progress: J. Davidson of Butte, who recently leased the Baltimore mine, near Basin, last week made a shipment of three cars of ore to the Butte smelters. The ore is copper, carrying gold and silver. The ore body is 5 feet wide. Years ago this mine was worked, and at that time it paid well from the surface ore. But the men who had it, after gouging out what ore there was in sight without doing any expensive development work, threw it up.

Marysville Mountaineer: The report of the last meeting of the shareholders of the Montana M. Co., Ltd., held in London, has been received. Among other things the report shows that for the six months ending June 30, 1898, 38,215 tons of ore were milled, yielding in bullion bars and concentrates \$265,879.82, or an average production of \$6.94 per ton. The expenditure on mining and milling operations amounted to \$248,320.97, equivalent to \$6.50 per ton, and the net profit obtained is \$17,558.85, or an average of 44 cents per ton. From the 18th of April to the 30th of June, 1898, 27,760 tons of tailings were treated and produced cyanide precipitates realizing as per smelters' returns, \$64,153.55, or an average of \$2.31 per ton. The expenditure, embracing the treatment and transport of the tailings and redemption of cost of the tailings plant, amounted to \$46,376.58, equivalent to \$1.67 per ton, and the net profit obtained is \$17,776.97, or an average profit of 94 cents per ton. The development of the mine the past half year represented 4650 lineal feet. Owing to the low grade of ore the result for the half year was disappointing. The average realized value of the ore passed through the mills was \$6.94, as compared with \$7.98 per ton in the previous half year, showing a decrease of \$1.04 per ton. On the other hand the expenditure was \$6.50, as compared with \$6.74 per ton in the previous half year, the net result being a decrease of 80 cents per ton on the 38,215 tons which were passed through the mills.

NEVADA.

The Cannon Co., controlling the Tea Cup group in Cherry Creek, in cleaning out a shaft that had been abandoned for eighteen years, found a good ore body and will begin the production of ore soon. The shaft had attained a depth of 400 feet during the early days, and while ores were uncovered, the grade was not sufficient to justify the owners in undertaking the long haul and the high treatment charges. The Chispa 10-stamp quartz mill in Montgomery mining district, Nye county, was destroyed by fire recently. The mine was owned by the Sterling M. Co. The ore pulp escaping in the form of tailings from the Hailey-Logan mill process at Como assays about \$20 per ton, of which \$13 is gold and \$7 silver.

Two carloads of ore shipped from Silver Peak to Salt Lake yielded, gold, \$80; silver, 25 ounces; lead, 33 per cent; the concentrates showed \$250 in gold to the ton.

The April Pool mine of De Lamar this week placed auro-cyanides of the value of over \$5000 in Salt Lake. It is locally stated that the capacity of the mill is to be increased early next spring.

A force is repairing the north branch of the Sutro tunnel drain flume leading to the C. & C. shaft. The shaft in the Robust mine at Ely is down 96 feet in ore all the way. A crosscut will be made at 100 feet.

White Pine News: The largest producing mine at White Pine being worked is the Homestake. The ore body has been tapped by a shaft at the depth of 250 feet. The ore averages 65 per cent lead, 15 ounces in silver and nets about \$20 a ton after paying the cost of transportation to San Francisco and charges at the smelter. Over 1200 tons of ore were shipped between July 1, '97, and July 1, '98.

The present lessees have employed twelve men all summer and shipped forty tons per week. On the Young Treasure the shaft is down a considerable distance and hoisting is done by a gasoline engine. Shipments of twenty tons per week have been made the past season. The San Francisco company controlling the Enterprise mine in Seven-mile canyon is sinking a shaft. Twelve men are making repairs in the Sutro tunnel, and Supt. Leonard says the company will be ready to handle the water when the pump is in place. Salt Lake experts are examining mines in Cherry Creek with a view of purchase.

Dayton Times: The Logan & Hully mill, in Como, has been running for two months and has returned enough to pay expenses of mine and mill. The tailings from the ore, however, go about \$20 to the ton—\$13 in gold and \$7 in silver—and to work these Logan & Hully will erect a leaching plant next spring. The Rock Point mill, at Dayton, was started up last week by Pierson & Davis. Ten stamps only are operating, but the other ten will be dropping soon unless the water is frozen. They are crushing custom ore; they are running on a lot from the Hartford mine in Silver City. They also leach tailings and guarantee to extract 78 per cent of the assay value. The Garrison mine at Cortez and the mill are both running. A strike is said to have been made on Seventy-six hill, Tuscarora, last week of a 4-foot vein of high grade. Tests of ore from the Benner mine, near Virginia, are being made by E. Williams, and, if the results are satisfactory, a tramway will be built for the transportation of ore from the Benner mine to the Nevada mill. The Adelaide ores are reduced at the plant in Goldconda; the output will be increased to 200 tons a day as soon as the railroad between the plant and property is completed.

Austin Revue: Hodge & Barago will soon ship a carload of antimony ore to San Francisco. They have a lease on Bray's mine at Big Creek.

NEW MEXICO.

On the Aztec mine, near Bland, the mill is running twenty stamps on \$40 ore, with several hundred tons on the dump. Machinery for the 150-ton mill to be built in the Timber Peak mining district must be hauled up the mountain from Socorro, where hitherto it has been thought hazardous for a saddle horse to go, and some of the pieces of machinery weigh 1200 pounds. The enterprise is backed by Philadelphia capital. The ledges vary from 100 to 200 feet in thickness. The average value of the ore is not over \$6.50 per ton. The Montezuma G. M. and Placer Co., of Morino valley, have twenty-five men in their employ.

Silver City Enterprise: The shaft on the Texas mine near Central has reached the 500-foot level and a crosscut is being run. At Hanover, Brockman & Hughes have eleven men taking out ore. F. Bell has six miners extracting copper pyrites from the Philadelphia mine. There are sixteen men employed on the Bear, Star, Whiffle, Tip Top, Sadie and Blue Jay mining claims, belonging to the Southwest Coal & Iron Co. W. Swancoat has twenty men extracting zinc ore from the Mineral Point Zinc Co.'s claims. The product is shipped to the company's smelting works at Mineral Point, Wisconsin. Twelve miners are taking out zinc ore on contract from other claims owned by the same company. At Santa Rita the Santa Rita Copper & Iron Co. is making shipments of iron ore to Pueblo. The Hearst Co., which has a lease and bond on some of the Santa Rita copper mines, has 100 men employed, most of the work being done under the tribute system. The shaft being sunk on the Carrasco mine has attained a depth of 205 feet. It will be sunk to 300 feet.

OREGON.

W. N. Wiley, from his mine near Antelope, shipped five tons of ore which milled \$43 per ton.

J. Haskell, who mined the past season on the Elk Creek placer mines at Susanville, brought to Baker City recently \$6018 in gold dust—a part of the last cleanup.

Sumpter News: The Badger M. & M. Co. is shipping between 50 and 100 tons of ore and concentrates per month. A good strike is reported at the E. & E., on the 300-foot level, 1½ feet wide in the 7-foot vein, which assays \$312 per ton. Thirty-dollar ore has been uncovered in Excelsior No. 2 tunnel. W. L. Vinson, representing Washington capital, has under bond the Magnolia, in which a 14-foot ledge has been crosscut. He has also secured a bond for \$25,000 on McAvoy & Sheridan's Little Giant group and contracted for a 300-foot tunnel.

Baker City Democrat: McAvoy & Sheridan have bonded their Little Giant group of mines near Baker City to W. L. Vinson, representing Washington capital, for \$25,000. Vinson has let a contract for a 300-foot tunnel. In a shaft above the proposed crosscut tunnel the ledge is 7 feet in width and shows good ore. The Magnolia, also under bond to Vinson, is being developed and looks promising. In the lower level work is being driven on the vein. A ledge 14 feet in width has been crosscut. In the Cracker Creek district a strike was made recently in the E. & E. mines on the 300-foot level of high-grade ore. The width of the ledge is 7 feet. In the Excelsior No. 2 tunnel a 5-foot ledge has been uncovered, assaying \$30 to the ton. In the Collateral a new vein was opened last week that will enable the Virtue Con. M. Co. to start their mill soon on a steady run of good ore.

Jacksonville Times: The Star Gulch M. Co., near Jacksonville, has the ditch completed and everything will be in shape for work when the rainy season sets in. Wyant & Co. are operating a placer mine near Ashland. Harmon & Green are making a good run in upper Galice Creek district. They have enough water to operate a 6-inch nozzle. J. Young of Steamboat precinct is crushing ore

with an arrastra.—F. G. McWilliams of Ashland, who is working a quartz vein in Farmer's Flat district, will have ore crushed in a short time.—The Hansen mines in Althouse district, recently bought by S. N. Butters and others, is being put in shape for extensive operation.

Ashland Record: The Gold Hill Q. M. Co. last week resumed work on the old Gold Hill ledge which produced the \$200,000 pocket in early days. The company have bought the Copper Queen, Daisy and Flora quartz claims and will have them developed also.—P. H. Oviatt owns a coal mine on Evans creek, which has a 14-foot vein.—R. Van Brunt has started up his placer mines for the season.

Ashland Tidings: The Seattle Co-operation Co. is preparing to hydraulic near Watkins.—At the Shorty-Hope M. Co.'s property work is pushed.—It is locally reported that the Brownings have made a second discovery near the Greenback mine that is promising.—The coal mine owned by Andrus & Reynolds on Evans creek is prospecting good.—The Free Silver mine of Barron & White, near Ashland, will be started soon.—Men are reported making \$1.50 per day at the Cameron placer mines.—The Gold Hill Quartz M. Co. has bought the Cooper, Flora and Savage claims in the Gold Hill district.—The Jump-off-Joe M. Co. has received two carloads of pipe at their mine near Leland.—The Lewis placer mine near Leland was started up last week.

Grant's Pass Journal: At the Ray Cook mine, near Grant's Pass, there are twenty men at work and they are in about 200 feet. The drift is from 50 to 100 feet wide and covers the old river channel. The gravel is being taken out of the tunnel in dump carts and thrown into sluices.—In the Hannum mine the new ledge is about a foot wide and assays \$80 a ton.

SOUTH DAKOTA.

The Big Bonanza mine at Terry outputs thirty tons per month.

UTAH.

The Cigale mill, the first plant erected on the West Dip at Mercur, has begun operations. The roasting or drying of the ore at the Golden Gate demonstrated that better results were to be obtained through the aid of heat and the installation of a roasting plant followed. The mill, that has a daily capacity of 400 tons, will be restricted to 100 tons on the start, the intention of the management being to mix the raw ores with the roasted mass, as has been done at the Golden Gate with satisfactory results. The Cigale mill is equipped with a set of seventeen self-dumping leaching tanks, the tailings from which may be removed, single handed, in a few minutes. The ore bodies have been blocked out to a depth of 900 feet.—The Wachusett of Lion Hill is taking out ore that assays eighty-three ounces silver and 83 cents in gold.

Shipments of ore from Park City for the past week were 1,654,210 pounds.

The Gold Dust M. Co., at Mercur, have resumed operations. A shaft has been put to a depth of 180 feet; ore running from \$6 to \$10 in gold has been found.—At the Bromine mine in the Henry mountains of southern Utah, a 5-stamp mill is crushing eight to ten tons per day and plating \$40 a ton. About 60 per cent of the ore is saved by amalgamation, and the tailings are concentrated and saved awaiting transportation facilities to the railroad.—About 150 men are at work on the placer properties on the Colorado river between the cataract and the mouth of the Grand river.

Blanchard & Firth sold a two-fifths interest in the South Mammoth in Tintic for \$20,000.

The Centennial Eureka mine at Eureka has opened an ore chute in which copper and gold predominate. Of this class ore bodies are exposed from the 900 down to the 1100-foot level. Of this class regular shipments are made, six cars having reached the sampler yesterday. The settlements show an average of \$7 in gold and 15 per cent copper. In addition to this some high-grade silver ore has been blocked out, while it would be difficult to approximate the amount of milling ore that awaits the erection of a plant with which to handle it.—The Dewey mill at Bingham is running on ores from the Red Wing, and another lot of concentrates was shipped last week.—On the Horseshoe group at State-line from the 100-foot level in the shaft drifts are run on in both directions, a recent sampling averaging \$17.60 per ton in gold.—On the Grand Central the tunnel has been run 300 feet.—From Frisco the Horn Silver shipped a carload of copper ore and three cars of concentrates.—At Tintic in the Pic Nic mine last week ore was broken into that yielded forty ounces silver and 50 per cent lead.

The Millard Progress is informed that the antimonial deposits at Coyote are showing profitable results. Nine claims are owned by the American Antimony Co., while another group has been tied up by C. Solomon of the Chapman smelter, San Francisco. The American Co. has leased its group for two years, the output going to New York and San Francisco, and consisting at present of about 100 tons per month. The miners are paid \$17 a ton and the freighters are paid \$6 per ton to the railroad. There are forty men engaged in extracting and hauling the ore.

The Tintic Miner reports shipments of the district the past week of 100 cars of ore, six cars of concentrates and five cars of bullion.

Mercur Mercury: In the South Daisy last week a strike was made that assays from \$9 to \$15.—The Ophir mill is shut down temporarily, but in the mine a large force is at work.—A boulder of ore was sent from the Northern Light to the company's office in Salt Lake that weighed eighty pounds and carried 1500 ounces silver and \$90 gold per ton.—The new roasters at the Golden Gate were fired up last week. Several of the new tanks are working and it is expected that everything will be completed in two weeks.—At Stockton in the Shamrock a strike has been made which

shows 62 per cent lead, 145 ounces silver and \$1.90 in gold per ton.—From the Argent shipments will soon begin on a large scale.

—The Honoria has been unwatered and sinking is in progress.—Shipments of high-grade ore from the No. You Don't have been temporarily suspended and the shaft is being sunk 150 feet deeper, which will give it a total depth of 550 feet.—At Mercur the Goyer-Marion mill treats 100 tons of ore daily.

Eureka Republican: A sample of ore from the Joe Bowers at Eureka showed 29 per cent copper and 138 ounces in silver to the ton.—It is pretty well authenticated that work will be resumed on the North Swansea about Jan. 1.

WASHINGTON.

Near Index, development is being pushed on the Keystone mine.—The Sunset is making an upraise from the lower to the upper tunnel, 110 feet. It has 4 feet of ore.—A force has been put to work for the winter on the Westland group near Galena.

H. M. Cooper claims to have discovered near Cle-Elum in Kittitas county an antimony mine and that assays show the test to run \$150 antimony and \$19 gold per ton.—The Lynch mines near Cle-Elum are bonded for \$100,000 to a Scotch company which is developing the property.

At Republic the Georgie Reed and Bull Dog group is said to have been sold to an Eastern company for \$12,000 cash.—Near Bossburg the Little Giant mine is working twenty men. The mine had been closed for a year.—At Republic two shifts are driving the tunnel on the Lone Pine and making 3 feet per day.

Two properties in Republic camp have been added to the Clark-Kingsbury-Frank group. They are the Rebate and Relief claims and work has begun on the Rebate. The company will be known as the Rebate M. Co., and will operate on the assessment plan.—The Treasury tunnel is in 330 feet on the ledge and quartz of good grade is taken out.—The Big Six M. Co. have put two shifts to work.

Near Bossburg the ledge running from the surface has come into the bottom of the shaft at the 490-foot level of the Bonanza mine, developing nearly 100 feet more depth of ore, with a 30-foot vein. The Bonanza is producing 100 tons of ore a day. As soon as the sled train is equipped it will convey four carloads a day to the railroad. The Bonanza is considered the largest lead producer in the State.

A strike of platinum is reported to have been made on Mad river in the Okanogan country. The property is owned by a Chicago company and is located about twenty-five miles north of Leavenworth. Tests of the ore made in New York are alleged to have shown 72 ounces of platinum worth \$14 to \$15 an ounce. It is unusual to find platinum in a quartz vein. It is usually found in the form of rounded or flattened grains of "sand," occasionally in irregular nuggets as large as peas and rarely in large nuggets, the largest yet found weighing twenty-one pounds, and coming from the west coast of South America. The ore is described by mineralogists as of a steel gray color, showing a shining light gray streak when rubbed on a hard surface, having a high specific gravity from 16 to 19, and being infusible in the hottest furnaces and insoluble in any single acid. It is soluble only in hot nitro-hydrochloric acid (aqua regia).

At Bossburg two carloads of machinery have arrived for the Young America concentrator.

The Ben Franklin M. Co. will keep men at work all winter. The company has a 12-foot ledge which assays \$20 to the ton.—At Springdale the Cleveland mine is pushing work and the ore is showing up satisfactorily.—At Palouse considerable work is being done in the Hoodoo and Jerome creek mining districts.—At Colville the Great Northern mine has a ledge full of gold-bearing ore that runs from \$22 to \$80 per ton.

WYOMING.

The output of coal in Wyoming will be increased 400 tons daily from the newly opened district in Crook county by Dec. 15, when a 20-mile branch of the Northwestern Railway system will be completed from Belle Fourche to the new mines.

FOREIGN.

BRITISH COLUMBIA.

The Athabasca mine near Nelson recently shipped a gold brick valued at \$9000. The company is clearing about \$1200 a day from the plates and they have the concentrates from the tailings left. There are 9000 tons of ore on the dump.—A concentrator is to be built at Sandon by the Ruth. The mine and mill will be connected by tramway.—Burns & Wilson bought a three-eighths interest in the California near New Denver for \$15,000. About \$7000 has been spent in development.

Last week the shipments from the War Eagle amounted to 1750 tons. The new electrical compressor plant is nearly complete.—In the Josie three machines are at work in the 200-foot level. The ore is of good grade and from 2 to 6 feet wide.—At the Center Star eighty men are at work.—The final payment of \$40,000 on the Mollie Gibson group of claims in the Kootenay has been made. The total paid for the property is said to be \$110,000.

The ore shipments from the mines adjacent to Rossland from Jan. 1 to Dec. 1, '98, are 118,971 tons. The shipments from Nov. 26 to Dec. 3 were 2300 tons.—The No. 1 will soon be equipped with a cage for lowering the men. The vertical shaft, which is down 200 feet, will soon be extended to the 300-foot level, and

a regulation cage of the Anaconda Co.'s type will be put in.

MEXICO.

Two Republics: The discovery is reported of a large body of free milling ore at Pulpito, Chihuahua, by J. S. Collinson, who brought to town half a ton of samples, which assayed 50 per cent lead and fifty ounces of silver to the ton. He will put on machinery and push development. He intends to work about thirty men.—A mine has been discovered near Conchas, the ore of which runs 45 per cent copper and thirty-two ounces silver.—C. Solis has discovered near Chihuahua an old Spanish mine. Besides the mine he found the remains of an old adobe smelter. The samples of the ore he brought assay 55 per cent copper, with traces of gold and silver.

The Molina mines in Chihuahua are yielding good results. The ores have silver, lead and gold. The Mexican Ore Co. of Kansas City has contracted for all the product. The ore assays fifty ounces of silver to the ton. The company has ready for shipment over 100,000 tons.—Flannagan & O'Donnell started from Chihuahua for Rio Fuerte with a 10-ton smelter, with which to treat ores on their properties in the district of Morelos. The assays from these properties show from \$400 to \$500 per ton. One of the properties is free gold and one is silver and copper showing 175 ounces of silver to the ton and 40 per cent copper.—The Rio Cancho M. Co. are working the placer deposits at Santo Domingo. They have expended \$250,000 on the property. The company is composed of Milwaukee capitalists. They expect to handle 5000 tons of dirt per day.

Nogales Oasis: The Ahogado mine near Hermosillo, Sonora, has been unwatered and started to sink and open up new workings. This promising property is owned by a company of which J. McNab of San Francisco is president.

ONTARIO.

At Mine Center, the Golden Star mill started up recently and is running night and day. The underground work is progressing and the ore in the fourth level is high grade.

The Independence mine made a test run of twenty-six days of their small mill, taking out \$2000 in gold.

Industrial Notes.

—The Sierra railroad will be finished to Sonora, Cal., by Jan. 1st, '99.

—Los Angeles, Cal., now gets a part of its coal from Gallup, N. M.

—The incubator has been introduced on the ostrich farms in southern California.

—The first railway to advertise in a Manila newspaper is the Denver & Rio Grande road.

—Three-fourths of the Washington State shingle mills have shut down to keep up prices for '99.

—The loss to the Standard Oil Co. by the recent fire at Los Angeles, Cal., is figured at \$325,000.

—The Sacramento, Cal., Iron Works, of Root, Nielson & Co., were burned last Wednesday; loss, \$60,000; insurance, \$20,000.

—The Santa Fe Railroad Co. abolished its land department Nov. 1st. Nearly all the large railroad corporations are doing the same thing.

—The U. S. Supreme Court has decided that the Territory of New Mexico has no right to tax the right of way improvements of the Atlantic & Pacific R. R. Co.

—The Standard Electric Co., has applied to Stockton, Cal., for a franchise to string wires to supply that city with electric power and light from Blue Lakes.

—The postmaster of Manila, Philippine islands, U. S. A., is W. W. Montague of San Francisco. The Manila P. O. is officially known as "Station No. 1, Philippine islands, San Francisco, Cal."

—On the Australian steamer last Wedne day came in gold from Australia to San Francisco \$3,413,933; this makes a total of Australian gold thus received since Aug. 22, 1897—less than sixteen months—of \$38,375,875.

—Last year there were over 400,000 Kangaroo hides received in this country from Australia and New Zealand. Prior to 1895 kangaroos were killed and eaten in Australia and their hides were cut up and made mostly into shoestrings and belts.

—The Nicaragua canal bill is being discussed in the U. S. Senate. As usual the railway interests vehemently oppose it. It is now proposed to lend the guarantee of the Government to the builders to the amount of \$115,000,000, the Government to be secured by a general lien.

—The Hudson Reservoir & Canal Co. proposes to build a reservoir sixty miles north-east of Phoenix, Arizona, at a cost of \$2,500,000 to hold water sufficient to irrigate 1,000,000 acres in the Salt River valley. The contemplated artificial lake will be 150 feet deep and cover eighteen square miles.

—Judge Belcher of San Francisco has decided that in ordinary commercial transactions the value of an English pound sterling is to be determined according to the fluctuations of exchange. The act of Congress fixing the value of a pound sterling at \$4 86 was held by the Court to be applicable only to the customs revenue of the United States.

—Benj. Belanos and Pablo Royal, civil engineers, have obtained a concession from the Mexican Government to construct a canal

which will put Mexico in direct communication with Guatemala. The canal will have a length of about 275 miles and will be 36 feet wide and 6 feet deep. The estimated cost of the undertaking is given at \$5,000,000, and two years is given as the probable time to complete the work.

—The report of the government engineers examining the Sacramento and Feather rivers, Cal., with the idea of their improvement, finds it possible by means of wing dams and dredging to make a channel with 7 feet to Sacramento, 4 feet to Colusa and 3 feet to Red Bluff at a cost of \$280,000 for the first section and \$25,000 for the last two sections. In the Feather river no work is deemed advisable until the flow of debris be stopped.

—In the State of Washington coal mines the following table shows the increase of tonnage mined since 1892, the number of lives lost annually and number of tons mined for each death:

| Year. | Total Tonnage. | Fatal Accidents. | Tons mined for each life lost. |
|-----------|----------------|------------------|--------------------------------|
| 1892..... | 1,140,575 | 55 | 20,737 |
| 1893..... | 1,308,850 | 9 | 127,750 |
| 1894..... | 1,131,860 | 50 | 22,633 |
| 1895..... | 1,163,737 | 35 | 33,249 |
| 1896..... | 1,302,524 | 8 | 150,315 |
| 1897..... | 1,302,192 | 7 | 190,027 |
| 1898..... | 1,717,515 | 9 | 190,613 |

Average number of tons mined for each life lost from 1892 to 1896 inclusive, 37,243. Average number of tons mined for each life lost during 1897 and 1898, 190,320.

—Talking of Japan's monetary condition, a recent arrival from there says the recent change of the monetary standard from silver to gold has exerted no appreciable effect on Japanese foreign trade, because their gold standard rests practically on a silver basis—that is, the ratio of value between gold and silver has been placed at 32 to 1 instead of 16 to 1, as advocated by American bimetalists, so that, though Japanese money is gold money, it has practically the value of silver money. Thus their 10-yen piece is worth only \$5 in our money, although it is a gold coin. Exchange stands at 50, just as it was before the change was made. The remarkable industrial advance has exerted an inevitable influence in the direction of raising prices, and many commodities have been more than doubled in price.

—More than \$1,000,000,000 worth of goods are every year imported into the countries adjacent to the Philippine Islands, and more than half that amount is composed of the class of articles produced or manufactured in the United States and offered for sale by her people. The importations into Japan, China, British Australasia and British India and Straits Settlements, amount to nearly \$1,000,000,000 a year. Those of Japan, which a decade ago were less than \$50,000,000, are now more than \$100,000,000, and steadily increasing. Those of China have increased 20% in the last decade and now amount to nearly \$200,000,000 a year. Those of British Australasia are nearly \$300,000,000 a year, and those of British India and the Straits Settlements, which show an increase of about 10% in the decade, are \$300,000,000 annually. More than half this sum of the imports of these four countries are classes of articles produced in the United States and offered for sale by her people. Of the eleven great classes of articles, China imported in 1897 \$90,000,000 worth, and of that sum \$11,000,000 worth came from the United States. Japan imported in 1897 \$58,000,000 worth, and of that sum \$12,000,000 worth came from the United States; British Australasia imported \$64,000,000 worth, of which \$12,000,000 worth came from the United States, and British India \$10,000,000 worth, of which \$3,500,000 worth was furnished by the United States. The following table shows the imports into the four countries in question of goods of the leading classes produced in the United States and offered for the export trade:

| Articles Imported. | China (1897). | Japan (1897). | British India Australasia (1897). | British India Australasia (1896). |
|---------------------------|---------------|---------------|-----------------------------------|-----------------------------------|
| Cotton mfrs. | \$61,357,358 | \$9,831,503 | \$6,708,287 | \$8,568,359 |
| Iron and steel. | 3,764,197 | 8,790,377 | 1,329,018 | 18,133,124 |
| Wool mfrs. | 544,694 | 713,220 | | 4,958,606 |
| Leather mfrs. | 2,434,202 | 249,340 | | 4,359,895 |
| Wood mfrs. | 2,119,055 | 3,902,466 | 805,176 | 9,007,730 |
| Machinery | 3,777,738 | 2,592,992 | 270,365 | 2,996,896 |
| Mineral oils and paraffin | 10,773,326 | 3,322,174 | 694,863 | 1,809,190 |
| Breadstuffs | 952,782 | 787,883 | 124,973 | 10,714,958 |

| Coal | 2,860,242 | 288,417 | 231,200 | 2,598,863 |
| Cotton, raw | 1,762,949 | 21,744,656 | 28,758 | |
| Total..... | \$90,031,058 | \$58,136,100 | \$10,511,651 | \$84,822,974 |

Recent Mining Incorporations.

Dewey Gravel M. Co., Grass Valley; capital stock \$3000, all subscribed; J. F. Goodwin, A. W. Hawley, D. Jones, C. E. Clinch, I. Haas.

The Globe M. & M. Co., Stockton; capital stock \$250,000, subscribed \$7000; J. A. Inglis, W. W. Worthing, R. B. Terry, H. Rumenapf, C. Roeder, W. W. Fitzgerald, C. L. Flack.

The Ralston Divide G. M. Co.; capital stock \$120,000, all subscribed; W. C. Ralston, R. R. Grayson, W. Bowers, F. Rigaud, P. G. de l'Estolle.

Kenai Lake M. Co., to mine in Alaska and elsewhere, San Jose; capital stock \$297,713, all subscribed; W. A. Towle, W. A. Smith, W. H. Adams, T. H. Farthing, C. M. Martin, J. H. McGee.

Coronado Copper M. Co., San Francisco; capital stock \$20,000, subscribed \$18,000; J. Blumenthal, R. Mohr, H. A. Hornlein, F. H. Hilbert, B. Adler.

A GOOD INVESTMENT

Three Dollars Brings This Paper One Year--Fifty-Two Issues. Can You Afford To Be Without It?

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 6, 1898.

615,516.—UMBRELLA CUP—J. Allesina, Portland, Or.
615,425.—PESSARY APPLIHER—E. A. Butler, Prescott, Ariz.
615,435.—CRAVAT—C. W. T. Davies, S. F.
615,544.—TENT—H. O. Flipper, Nogales, Ariz.
615,548.—BROILER RANGE—T. Guinean, Portland, Or.
615,449.—METALLIC SHEATHING—T. F. Hagerty, S. F.
615,553.—WIRE CUTTER—D. O. Hite, Sacramento, Cal.
615,554.—CAR DUMPING APPARATUS—W. Hogan, Washington, Cal.
615,621.—BURIAL APPARATUS—E. C. Jobson, S. F.
615,403.—MUSIC TURNER—A. McRae, Milton, Or.
615,589.—AIR SHIP—F. R. Merritt, Prairie City, Or.
615,588.—OFFICE INDICATOR—Moore & Oliver, Stockton, Cal.
615,489.—ORE WASHER—L. J. Mytinger, Sacramento, Cal.
615,571.—DOOR LOCK—J. Ohring, S. F.
615,572.—CARBURETOR—O. Owens, S. F.
615,389.—ORE STAMP—D. M. & J. E. Smyth, Pasadena, Cal.
615,334.—SHIPPING PACKAGE—C. Toohy, S. F.
615,598.—DUMP WAGON—G. M. Wallace, Yuba City, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BURIAL APPARATUS.—E. C. Jobson, San Francisco, Cal., assignor of two-thirds to Fannie F. Williams and Ada M. Jobson of same place. No. 615,620. Dated Dec. 6, 1898. This invention relates to a device which is especially designed to be employed during the burial of persons, and it acts to receive and lower the casket, at the same time closing in over the casket, as it descends, an ornamental or flower-covered screen. It consists essentially of an open framework adapted to rest about the periphery of the grave, and arched or ornamental screens pivoted to the framework, extending along upon each side and normally open from each other, leaving the space above the grave. Within this space is a casket-supporting frame with attachments and pulleys by which it may be lowered into the grave, and as soon as the casket commences to descend the pivoted segments upon each side are closed in above it. These segments may be ornamented permanently, or they may be made of wire screenwork and adapted to receive flowers, with which they may be entirely covered, so that when closed together they resemble a bank of flowers and entirely conceal the casket and the grave.

DUMP WAGON.—George M. Wallace, Yuba City, Cal. No. 615,598. Dated Dec. 6, 1898. The object of this invention is to provide a wagon designed to carry loads of earth or loose material, and a novel means for suspending, opening and closing the bottom boards of the wagon. It comprises a body with closed sides, transverse end beams, bottom boards having pivot pins projecting from the opposite ends, near one edge, so that the bottom boards swing to and from each other in pairs, transversely slotted timbers are provided in which the pivot pins are loosely movable, transverse shafts journaled and turnable at opposite ends of the wagon have lever arms projecting above the meeting edges of the bottom boards, and links pivoted to the ends of said lever arms have transverse slots made in the lower ends, hangers are provided, the upper ends of which are pivoted in the transverse slots, and the lower ends connected respectively with the swinging edges of the adjacent boards so that the hangers diverge freely when the boards swing apart and are correspondingly drawn together when by the action of the controlling mechanism they are again drawn up into place.

CAR-DUMPING APPARATUS.—Wm. Hogan, Washington, Cal. No. 615,554. Dated Dec. 6, 1898. This invention relates to a device which is especially useful for dumping cars to discharge the load therefrom, and again right the car. The object is to provide a convenient means for discharging loads from cars and other similar vehicles, and to easily return the vehicle to its normal position. The tracks upon which the cars approach connect with a short section of track sufficiently long to receive the car to be dumped, and this section is supported upon rollers or segments which rest upon rollers beneath so that when the car has been run in upon the section of track it is latched by a special holding device which secures it to the segment, and the segment is then turned about on the supporting rollers until the car stands at such an incline that it will discharge its contents through the lower side, this side having a swinging gate which opens for the purpose of allowing the discharge. Stops are arranged with relation to the segments so that when it returns to its normal position the section of track will be exactly in line with the main track.

DOOR LOCK.—John Ohring, San Francisco, Cal. No. 615,571. Dated Dec. 6, 1898. The object of this invention is to combine an arrangement and lock for doors in which a suitable bolt is so connected with operating mechanism that it may be used as an ordinary latch, operated by turnable knobs from either the inside or the outside, or both, and with it is a stop by which the operation through the outer knob is prevented except by the use of a latch key, said knob being pro-

vided with tumblers arranged to receive such key and means for so locking the bolt that it cannot be turned from either outside or inside. In conjunction with this is an independently operated tumbler lock acting upon the same bolt and serving as a night or permanent lock to prevent its being withdrawn by an operation of any of the previously described mechanisms.

Personal.

C. C. BEAN is Supt. of the Ajo copper mines, Yuma, Ariz.

F. KING is Supt. Hanson mines near Jacksonville, Oregon.

CAPT. DE LAMAR of Utah and Nevada is in San Francisco.

C. D. LANE now becomes Supt. of the Utica mine, Angels, Cal.

C. C. CLARK has been appointed Supt. Lone Star mine, Bland, N. M.

GEO. E. AMES, resident engineer Anaconda M. Co., in visiting San Francisco.

W. A. BELL of London, England, is visiting his Gopher-Boulder mine at Kelsey, Cal.

V. M. CLEMENT has been appointed Gen. Mgr. De Lamar mines, De Lamar, Nevada.

M. HEALEY, representing Capt. DeLamar, is visiting the Baker City, Or., gold fields.

J. J. CRAWFORD has returned to San Francisco from Calaveras and El Dorado counties, Cal.

P. KERVIN, Virginia, Nevada, is examining the Silver Peak mines in Esmeralda county, Nevada.

F. E. LELAND of the Risdon Iron Works has returned from a business trip to Virginia City, Nevada.

F. ZEITLER, Supt. Champion mine, Nevada City, Cal., has returned from the Unity mines at Single Springs, Cal.

D. KIETH, managing owner Silver King mine, Park City, Utah, passed through San Francisco last week enroute to Mexico.

J. A. TURNER has been appointed Gold Commissioner at Nelson, B. C., for the Nelson, Arrow Lake and Goat River mining division of West Kootenay district.

F. KLEPETKO, Gen. Mgr. Boston & Montana M. Co., Butte, Mont., is at the Highland Boy smelter at Bingham, Utah, to decide upon the plant's electrical requirements.

F. SEARLES, mine owner and attorney, Nevada City, Cal., is in San Francisco, in attendance upon his father, Judge Niles Searles, who has been seriously ill.

Recently Declared Mining Dividends.

Mercur, Utah, \$20,000; payable Dec. 20.

Florence M. Co., Montana, 3 cents per share, \$25,000; payable Dec. 20.

Centennial Eureka, Utah, 50 cents per share, \$15,000; payable Dec. 20.

Nugget M. Co., Colorado, 2 cents per share, \$20,000; payable immediately.

Matoa G. M. Co., Colorado, 2½ cents per share, \$25,000; payable Dec. 24.

Portland, Colorado, 2 cents per share, \$60,000; Dec. 15.

Mercur, Utah, \$25,000; payable Dec. 20.

Bullion-Beck, Utah, \$10,000; Dec. 15.

Commercial Paragraphs.

THE Hercules Gas Engine Co. are removing from the former location, 405-7 Sansome street, to commodious quarters at 305 Market street, San Francisco, Cal.

THE Curtis-Newhall Advertising Co., the southern California representatives of the MINING AND SCIENTIFIC PRESS, have removed to enlarged offices at 223 W. Second St., Los Angeles, with superior facilities for work.

THE Denver branch of the Jeannette Iron Works Co. report recent sales and shipments: Moon-Anchor gold mines, Cripple Creek, one 8½x18 electric power pump, lift 600 feet; one Jeannette sinker, No. 9 B., size 14x13, 650 feet 10-inch column pipe and fittings; Colorado Fuel & Iron Co., Watsonburg, one 8x12 electric power pump; Bunkers mines, Leadville, duplex station pump, 600 feet lift; Penn M. Co., station pump.

A CHANGE of name has taken place in the business of the Rix Compressed Air Machinery Co., which will hereafter be known as THE Compressed Air Machinery Co., Wm. A. Hewitt and P. H. Reardon, proprietors, who will continue at their present location, 11 and 13 First street, San Francisco, Cal. This company do a large business in manufacturing improved air compressors and the Giant Rock Drill, and also handle the well-known Chandler & Taylor steam engines and boilers and general mining machinery. Among the orders now being filled is a large steam-driven compressor of the Corliss type for the well-known Kennedy mine, and a number of smaller compressors and drills are also under construction.

Obituary.

HENRY MORTIMER PLATT died this week in New York City, aged seventy-six years. Fifty years ago he established in that city the first gold and silver refinery in the United States.

You may pay for Experience

but the man who's wide-awake, gets it at some one else's expense.

If you're going to pump—tell us. What we tell you may save many regrets as well as many dollars.

We also send our catalogue—all free.

SAN FRANCISCO, CAL.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark.

Our German drawing instruments bear only the trade marks  or . We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Baragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

THE J. H. MONTGOMERY MACHINERY COMPANY.

1216 TO 1230 CURTIS ST., DENVER, COLO., U.S.A.

More than 4,000 in use. Made of wrought iron and steel. Can be packed on animals anywhere. The deadlock holds the load when an accident occurs.

Price of One-Horse Whim, complete, with shieves.....\$90.

Two-Horse Whims, complete, with shieves.....\$150.

Pumping Attachment with Pipe for either.....\$40.

Blower Attachment with Pipe for either.....\$30

Also Four, Eight and Twelve-horsepower Whims.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675.
Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will
take the place of two or
three belt concentrators of
any style and do very much
better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

**THE
BRYAN
ROLLER
QUARTZ
MILL.**

Is constructed on the principle of the Chill Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post.

SEND FOR
CATALOGUE NO 8.

THE BRYAN ROLLER QUARTZ MILL

We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. Strong. Economical. Simple.

Don't Take Chances!

PROVIDE YOUR MINERS WITH A

RUNDLE POWDER THAWER.

A convenient and absolutely safe device for thawing high explosives. Zero weather means an increased loss of life from carelessness in thawing Giant Powder. Don't let it be on your properties.

Harry A. Lee, Commissioner of Mines, State of Colorado, says of the RUNDLE POWDER THAWER:

"It reduces the risk incurred in thawing frozen powder to the minimum, and its universal use in accordance with your instructions would save the lives of many miners annually."

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

The Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand
Wheels

Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

MINING AND SCIENTIFIC PRESS,

330 Market Street, San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition: Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations: well bound in cloth; 1896. Price, postpaid, \$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid, \$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....\$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kuestel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid, \$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....\$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid, \$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is especially applicable to the Pacific Coast. Price, postpaid, \$2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid, \$6 00

The Metallurgy of Gold.

By M. Elsäser. Profusely illustrated.....\$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....\$1 50

Quartz Operator's Handbook.

By P. M. Randall.....\$2 00

Skeleton Mining Report.

Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid, \$5 00 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid, \$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....\$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc. By Prof. Magnus O. Ihseng, E. M., Ph. D. Third, revised and enlarged, edition. 348 pages, 8vo., cloth.....\$4 00

The Lixivation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....\$5 00

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....\$2 00

Assessment Notices.

MABINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of November, 1898, an assessment (No. 16) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of December, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1898, an assessment (No. 2) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of December, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 17th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
J. MIDDLETON, Secretary.
Office—213 Jackson street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of December, 1898, an assessment (No. 32) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 23d day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
CHARLES E. ANDERSON, Secretary.
Office—Mills building, room 31, 10th floor, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of December, 1898, an assessment (No. 23) of three (3c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

NATIONAL CONS MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 5) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
GEO. W. FLEISSNER, Secretary.
Office—773 Mission street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of December, 1898, an assessment (No. 15) of 1/4 of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 2nd day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
J. J. CRAWFORD, Secretary.
Office—No. 1209 Claus Spreckels building, San Francisco, California.

ANNUAL MEETING.
The Regular Annual Meeting of the Stockholders of the CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY will be held at the office of the company, 113 Crocker building, San Francisco, California, on THURSDAY, the 15th day of January, 1899, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Monday, January 9th, at 4 o'clock P. M.
J. F. HOLLING, Secretary.
Office—113 Crocker building, San Francisco, California.

ANNUAL MEETING NOTICE.
The Annual Meeting of the Stockholders of the EUREKA CONSOLIDATED DRIFT MINING COMPANY will be held at its offices, Nos. 1209-1211 Claus Spreckels Building, San Francisco, at 1 o'clock MONDAY, December 19th, 1898.
J. J. CRAWFORD, Secretary.

Oregon Short Line RAILROAD

AFFORDS THE BEST ROUTE TO THE GREAT NORTHWEST.

Is the only line operating through Pullman Palace and Tourist Sleeping Cars from Denver to Portland, Oregon.

THE GREAT GOLD MINING DISTRICTS

—OF—
MERCUR (UTAH), KOOTENAI, KLONDIKE,
Are best reached via
THE OREGON SHORT LINE RAILROAD.

IRRIGATED LANDS OF IDAHO.

Thousands of acres of the choicest lands of the West are located along the line of THE OREGON SHORT LINE RAILROAD in Utah, Idaho and eastern Oregon. Splendid opportunities for the Investor, the Farmer and Fruit Raiser.

D. E. BURLEY, Gen'l Passenger Agent,
SALT LAKE, UTAH.

THE OREGON SHORT LINE RAILROAD.

Colorado Midland Railroad

Reaches the Grandest Scenery in the World:

Ute Pass, Hagerman Pass, Hell Gate, Pike's Peak, Mount Sopris, Mount of the Holy Cross.

The Most Beautiful Summer Resorts in Colorado:

Manitou, Cascade Canyon, Green Mountain Falls, Woodland Park, Glenwood Springs.

The Most Famous Mining Camps:

Cripple Creek, Victor, Leadville, Aspen.

W. F. BAILEY, Gen. Pass. Agt., Denver, Colo.

MICHIGAN COLLEGE OF MINES.

Supported by the State of Michigan. Practical work. Electric system. Special advantages for men of age and experience. For catalogue address
DR. M. E. WADSWORTH, President, Houghton, Michigan.

“DEARBORN Vegetable Preparations FOR BOILERS.”

Weber Hoists.

6 to 100 H. P.

Cost to Run, 1c per hour per H. P.

All Latest Improvements.

La Sal Mountains.

NEW, RICH MINING DISTRICT.

Best reached by way of the

Rio Grande Western Railway
from CISCO or THOMPSONS stations.

Daily stage from Thompsons to Moab—here outfits can be secured at very reasonable rates—thence by wagon or saddle to LA SAL MOUNTAINS, twenty miles distant.

The formation is igneous and all the metamorphic rocks abound. Veins of quartz, quartzite, porphyry, granite and spar are well defined. The district promises a great future.

Send to F. A. WADLEIGH, Salt Lake City, for pamphlet.

Colorado's Mining Industry.

There have been a number of interesting and instructive pamphlets issued on this subject by the U. P. D. & G. Ry. and the South Park Line, Colorado's progressive railroads, which reach the principal mining centers of this vast mineral section. They are all carefully and conservatively prepared and will be mailed upon receipt of request and necessary postage. The various publications are as follows:

- La Belle Gold Fields, 2c.
- Gunnison Gold Belt, 2c.
- Hints to Prospectors, 2c.
- Ward Mining District, 1c.
- Pine Creek, 1c.
- Puma, 1c.
- Breckenridge Gold Belt, 1c.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY, SUTTER CREEK, AMADOR CO., CAL., Feb. 23, 1897.

Yours truly, JOHN ROSS JR., Superintendent.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

Yours truly,

EUGENE MAY, Foreman.

For any information regarding Frue Vanner or Belts, call on or address

—MANUFACTURERS OF—

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines
OUR SPECIALTY.

We build GOLD DREDGES COMPLETE IN RUNNING ORDER to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard. We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

THE CALHOUN EXCAVATOR. A COMBINED POWER-SHOVEL AND CABLEWAY.

Cableways, Double Rope Tramways, Wire Rope Transmissions,

Incline Planes, Logging Machinery, Suspension Bridges,

DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 330 Market St., San Francisco, Cal.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.

Separates ALL the minerals from each other at one operation. Gives THREE CONCENTRATES on the one Machine at the same operation. The Machine is especially adapted to the separation of Zinc and Lead.

SIZE OF MACHINE.....4 ft. by 8 ft.

WEIGHT.....1000 Lbs.

CAPACITY.....10 to 30 tons per 24 hours.

CAN BE SET UP ANYWHERE.

REQUIRES NO SPECIAL FOUNDATION.

THREE CLASSES OF MACHINES ARE MADE.

Table A is adapted to concentration from 2 into 1 to 8 into 1.

Table B, 6 into 1 to 16 into 1.

Table C, 12 into 1 to 32 into 1.

Parties desiring tests made can send 500 lbs or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed \$10.00.

Price of the Table \$300 Complete, f. o. b. Cars, San Francisco, Cal.

Licensee for the Manufacture and Sale,

Motor Road Locomotion.

The railroad locomotive was not the first "horseless carriage." The idea developed from the velocipede, and when a moto-velocipede was almost perfected, motives for reduction of friction caused it to be put on rails; hence the origin of the modern railway. The truth of this is shown in the designs of automobiles in the eighteenth century, which were fashioned after velocipedes, and not after the carriage. The modern successful automobile has been designed on the plan of the latter. While, ordinarily, invention or improvement originates in this country, or is best practically developed here, in the case of motor road locomotion (as applied to the carriage of passengers) the invention is a European one, and in that country is so far carried to greatest perfection. In England and France, automobiles are becoming as common as the bicycle in San Francisco or Denver. The machine has developed along the ugly lines of a buggy or carryall, rather than seeking an individuality for itself through designs which would be more fitting to its peculiar qualities. Although much of the bicycle gear was added to improve the fleetness of some of these automobiles, the basic idea of four wheels, two axles and a body box remained. Naturally, the requirements of inventors and manufacturers omit the question of beauty in the machine. They want vehicles that may be run cheaper than anything in that line drawn by horses; they want speed, and capacity for carrying passengers. It does not matter to drivers or owners how ugly the machines look as long as they bring in more money than do the vehicles drawn by horses.

This fact was recently emphasized at an exhibition held in Paris, where the only vehicles admitted to competition figured in the following categories: Closed carriages for two persons; open carriages for two persons; mixed carriages for two persons, capable of being instantaneously closed or opened; carriages for four persons, with space for baggage, sixty-five pounds to each person; open carriages, with hood, for four persons; closed carriages for six persons, with space for baggage, sixty-five pounds to each person. The vehicles had to be so constructed that all persons could be comfortably seated therein, and had to be provided with an odometer or kilometer counter with two brakes, one progressive and the other instantaneous. Out of the twenty-six vehicles booked, sixteen were electric and ten gasoline, which would indicate that steam as a motive power in the automobile would not be employed in general use for the lightest variety of road carriage, though, in London, steam road vehicles have been further developed

than in the case of either gas or electricity. In the latter city there are several designs of steam omnibuses, motor omnibuses, and "petrole" cabs. In the first of these vehicles steam is generated by a slow combustion stove which consumes only a very

RIKER ELECTRIC VICTORIA.

small quantity of coke or petroleum. The omnibuses are of 20 H. P., and one vehicle, it is asserted, can accommodate twenty-eight passengers. The cost per passenger is stated to amount to one-tenth of a cent per mile. Speed would be developed from eight

which has since worked satisfactorily, the motive power being a 2 H. P. gas engine. The machine was calculated to carry three persons on a single broad seat, though operated by one, with surplus power sufficient to take on a trail vehicle, according to the character of the road. It carried twelve hours' supply of gasoline—two and one-half gallons—and attained a speed of from ten to twelve miles per hour on favorable ground. Being geared in such a manner that the movement of a lever increased or decreased the speed, enabled it to climb grades of considerable pitch. It was safe, simple in construction, the design of the inventor being to have as few pieces and parts as possible. In the broader field of freighting, the Daniel Best Manufacturing Co. of San Leandro, Cal., have shown what skill and enterprise can do in that direction, building powerful, successful and practicable road engines, with a capacity for hauling a loaded train of wagons weighing 100,000 pounds on ordinarily level roads, and lighter loads on grades of one foot in eight, this firm, however, confining their successful scope of work to supplying the requirements of the freighter. In New York City an electrical vehicle company is putting out some cabs and coupes, and in Brooklyn the Riker Electric Motor Co. are building similar handsome vehicles. In the one herewith illustrated the tires are 3x32 inches front, 36 inches rear; wheel base, 63 inches; tread, 50 inches; weight, 1800 lbs.; carrying capacity, two passengers; one motor, 2½ K.

W.; controller gives three speeds ahead and two to the rear; maximum speed, twelve miles per hour; total mileage, twenty-five miles on level asphalt or macadam, per charge; combination voltmeter and ammeter; electric side lights; driving from rear wheels and steering from front wheels. In some of the more recently constructed electrical carriages a speed of twenty hours has been attained under favorable circumstances. In a "wagonette" propelled by steam, built by an English concern, a speed at the rate of twenty-five miles per hour was secured. This vehicle carries twenty-two people, and can climb a grade of one foot in seven, fully loaded. Another steam vehicle built by the same company, carrying six persons, has, on country roads, covered a distance of one mile in one

CALIFORNIA GAS ENGINE TRICYCLE.

to ten miles an hour, and may be increased to fifteen miles.

In the United States, wherever the grade of the road or street will permit, automobiles will sooner or later find their way. Already several American firms build them. Over four years ago a San Francisco firm manufacturing gas engines—A. Schilling & Sons, 211-213 Main St.—on an order from a resident of Santa Maria, Santa Barbara Co., Cal., built a gas engine tricycle, illustrated herewith, and

minute and ten seconds. Of course, the words "country roads" have in England, or on the continent, a different significance from what they have in this country. In the United States, as it "fills up" and we are able to devote needed time and money to the important question of better roads, traction engines, electric motors, steam and petroleum wagons, and automobiles in general, will come into more general use. As a rule, the American people are learning the utility and economy of good roads.

Electric Power Development in California; Weber Gasoline Hoisting Engine, 636.

UTAH is developing considerable business in its mining stock exchange at Salt Lake City. Transfers for the week ending December 17 aggregated 381,339 shares, selling for \$121,623 88.

THE California State Miners' Association is enlarging the scope of its operations. Designed originally to secure justice for the hydraulic miner, it has severally taken up the mineral lands fight, the securing of additional State and national legislation, the creation of a national cabinet department of mines and mining, and is now essaying the handling of the California mineral exhibit at the Paris Exposition and the conservation of the waters of the State.

COLORADO furnishes a wonderful example of recuperation from untoward mining conditions. When the slump in silver wreaked ruin on the leading industry of that commonwealth, and gold was in the ascendant, the miners of the Centennial State tacitly said: "Very well. Just mention what you want; if it is gold, we will furnish that," and straightway forged to the front as gold producers—Colorado's gold yield this year being estimated to aggregate nearly \$25,000,000.

Some Surprising Statements.

With some surprise is read in the *New York Bankers' Magazine* an article from Mr. T. A. Rickard, State Geologist of Colorado, in which that usually accurate gentleman says:

Nine mines out of ten are sold for more than they are worth. More money is made by selling than by buying them. Much of the so-called business of mining is based on a scant knowledge of its operations, and a profound recognition of the essential foolishness of human nature. A man usually buys a mine, not because it is worth the price he pays for it, but because he is justified in the expectation of finding some one who will pay more for it. The syndicate sells to the public; the public sell among themselves. The second man hopes to meet a third with more money and less sense. So the game proceeds.

It is seldom that so prominent a man in so prominent an industry decries his own business and endeavors to degrade its standing. Such misleading utterances are always gladly seized on by those who attempt to justify wrong action by the miserable plea: "they all do it; why not I?" According to the above, the business of mining is mainly a game of cheat and bluff, on the part of fakirs, swindlers and dealers in "green goods." Mr. Rickard's own experience directly contradicts his published utterances, and the general facts patent to all make unnecessary any attempt to show the fallacy of such assertions. Ordinarily, such flings at mining are attributed to private pique, peculiar ignorance, or personal disappointment, and go unnoticed; but in the case of Colorado's State Geologist, who is genial, well-informed and successful, it is to be regretted that his recent visit to the old country should have so warped his views. It were unfortunate for Colorado or any other great mining State did such statements have substantial basis—an unlikely contingency.

Should Have Representation.

In 1900 will be taken the Twelfth Census of the United States. Originally intended to be a correct compilation as to the number of inhabitants, their birthplace and avocation, the U. S. census in the last few decades has become the most complex thing of the kind in existence. So extended and involved are the myriad statistics now gathered that each census costs several million dollars, and the facts so secured are not published in their entirety till it is about time to prepare for the next one. Thus, it is only recently that the mass of figures obtained in the census of 1890 has been finally given out. Everything conceivable has been figured on and with—except mining, distinctively. The number of Indians in the State of New York under fourteen years of age who have attended school three hours each school day; the average individual amount of money brought by immigrants from South America to New Orleans in January, 1892; and the difference between the earnings of the French-Canadian operatives in Massachusetts cotton factories and the negroes in South Carolina rice fields has been figured out in minute detail and published in substantial shape—but nothing about mining, specifically. On June 16, 1898, Senate bill 4545 passed the U. S. Senate. It provides for the twelfth census in 1900. It didn't pass the House, so will come up before this present short session or before the 56th Congress which convenes March 4, 1899. Section 24 of that bill enumerates what shall be considered; what statistics shall be secured in that census which costs so much of public money, and which ordinarily will be within public purview about 1906. In that section, and in fact in the whole bill there is not a word that would lead any one to suppose there was such a thing as a mine in the United States. The country's greatest basic industry; the one thing upon which primarily the prosperity of the whole country depends is utterly ignored. The only industry of the only prosperous section of the United States, is not of sufficient importance to have separate and distinct place in the Twelfth Census of the United States, though were it not for that industry the country's western boundary would be the Mississippi river, and the census would be a comparatively small affair. Where were the Senators from the great mining States when this bill passed the U. S. Senate? Of what use is a census that does not enumerate things of value, and what in this country exceeds in value or importance the mining industry? In the Congress of the United States now in session at Washington, D. C., sit 90 Senators and 357 Representatives: of these 447 men 22 Senators and 43 Representatives were elected from great metal mining commonwealths. It is within bounds to suggest to these 65 gentlemen, singly and collectively, that any one of them could be of some service to the nation, and possibly to himself, were he to interview the chairman of the Committee on Twelfth U. S. Census, or, if in the House, take fitting action, to see that in the bill authorizing expenditure therefor is a clause making specific appropriation of an amount sufficient to insure publication therein of official statistics of the mineral industry of this country. Distinct from all other industries, mining in '97 produced in this country values aggregating \$623,312,347. Possibly detailed statistics thereof would be as beneficial and interesting to some of the public who pay for the census as are elaborately illustrated volumes on the difference between the entomological structure of the lady-bug found on the leaves of Vermont cabbages and the moths that infest the buckwheat fields of northeastern Maine.

A SUIT involving \$750,000 was decided in a Boston, Mass., court this week in favor of the California defendants. In September, '95, Messrs. Nevills, Martin & Ballard of San Francisco gave G. M. Pinney authority to sell 100,000 shares stock in the Rawhide Gold Mining Co. at \$15 per share. On March 23rd, '96, C. W. Norton of Boston made proffer of the amount—\$1,500,000—for the stock, but Messrs. Nevills, Martin & Ballard declined then to transfer the stock for less than \$25 per share. Norton thereupon brought suit for \$750,000 damages. Defendants claimed that at the time of making the arrangement with Pinney they had reserved the right to change the minimum price at which the

stock was to be sold, that plaintiff understood this, and that between September 23rd, '95, and March 23rd, '96, had notice of such change, and that Pinney had no authority, at the time of the proffer of the \$1,500,000 by Norton, to sell the stock at that figure. The case will be appealed to the U. S. Supreme Court.

Storage of Water.

At its meeting last month the California State Miners' Association recommended the appointment of a committee of five "to consider the question of the storage of water." Whether that is or is not in the province of the Association, the subject is of prime importance to every California producer, be his product of the field, the forest or the mine. The question is one of ways and means. Water exists in abundance. Its manner of existence, the topography of the State, the great annual waste, the resultant loss, and the manifest need of water storage, constitute a problem for hydraulic engineers to successfully solve, and is a matter that deserves attention.

At various times the United States and State governments have realized this; considerable money has been spent and valuable data secured, forming a basis for intelligent action. It would seem that utilization of the larger streams, construction of storage basins and storm water reservoirs, controlling the flow of the smaller streams and utilizing the mountain lakes, could rationally be made the basic principle of the proposed work. Objections in plenty will arise: vested rights; mining ditches and dams, long acquired private storage systems built and maintained at great cost must be protected. The general character and manifest cost of the work militates against the idea, and occasions a generally felt idea that, if expressed, would be about this: "The surplus water should be stored, and the need of some such scheme is plain; it must be done sometime, but how it is to be done is beyond suggestion." And yet, with the water at hand, and the great need of the State, mountain lakes full of what is needed to make miner and farmer continuously prosperous, it would seem that the same genius of American invention that has succeeded in equally arduous work could find a way to settle the intricate question. Reservoir sites and natural reservoirs are abundant. Lake Tahoe, filled from a catchment basin of 500 square miles, has water enough to cover 500,000 acres in the valley below one foot deep. This water is susceptible of storage by providing for the discharge of four feet of water from the surface of the lake through each summer, and the conservation of the same amount annually through each rainy season. At the altitude of Lake Tahoe, over a mile vertically above the thirsty valleys it could fructify, evaporation is at its minimum, the water is the purest; the adjacent land can be utilized for no other purpose but summer pasturage. That is but one; scattered along the axial of the Sierras are a hundred lakes, natural reservoirs, whose aggregate area approximates 1000 square miles, each with the same general characteristics briefly noted in reference to Lake Tahoe. There is enough water in these natural reservoirs to furnish power to every mine in California and irrigate every arid acre in the State. This is exclusive of the reservoir sites and the natural unrestricted flow of the streams.

Other sections have the same problem on a smaller scale, and are attempting its solution. The reservoir plan appears the most feasible. It is manifest that this question must ultimately be settled; it may be postponed year after year, but must sooner or later be ultimately disposed of. It is also believed that, while the California State Miners' Association deserves commendation for intelligently noting such general need, it is not for that Association or any other private organization to take up the work. That rightly rests with the general Government, and California would be justified in calling for adequate national appropriation therefor.

A LONDON contemporary disbelieves recent published statements regarding achievements in long-distance electric power transmission in California and Utah. England has no water power and it is, perhaps, difficult from an insular standpoint to credit or understand what is being done elsewhere.

Concentrates.

Pure copper weighs 555 pounds per cubic foot.

"The top width of an earthen dam 64 feet high" should be 18 feet.

OREGON papers call for a law in that State against "salt-ing" mines.

The Portland G. M. Co. of Cripple Creek, Colorado, has paid this year \$510,000 in dividends.

A 3-inch iron pipe 1 foot in length contains .4418 cubic foot, 3,905 gallons, weighs 27.5 pounds.

For the 39th time the MINING AND SCIENTIFIC PRESS wishes its readers "A Merry Christmas."

AVERAGE soft coal is made up of carbon .812, hydrogen .048, oxygen .054, nitrogen and sulphur .031, ashes .055.

MINING location blanks may now be secured at the office of almost any newspaper published in a mining country.

PAY gold is alleged to have been discovered in Utah coal. Over twenty years ago gold was found in coal at Tallawang, N. S. W.

The dielectric strength of an electric insulator is its ability to stand the mechanical and electrical stresses due to the voltages used.

The gold output of the Witwatersrand, South Africa, gold fields for October, '88, was 27,165 ounces; for October, '98, 400,791 ounces.

The 18 knots per hour recently made by the torpedo boat Farragut, in San Francisco bay, equals a rate of 34 7/8 statute miles per hour.

ONE "candle power" is the light given out by one standard candle, the basis being the burning of two grains of sperm candle per minute.

DEPUTY MINE INSPECTOR NYE of Colorado reports 3000 men on the payrolls of Cripple Creek mines. The daily wages are \$3 for underground work.

U. M. VOICE of Malaga, Fresno Co., Cal., claims to have discovered gravel there "yielding over 50 cents to the pan, as well as a large percentage of platinum."

SEPT. COLCORD attributes the closing of the Carson, Nevada, mint coinage department to its being ignored by home producers sending their bullion away for coinage.

The Los Angeles, Cal., Mining Review and the Redding, Cal., Searchlight are good examples of local publications north and south that aid in the State's mineral development.

In the U. S. Senate this week was introduced a joint resolution providing for a division of mines and mining, under the Geological Survey. The resolution provides for \$115,000 to carry on the work.

THERE are eleven miners' unions in Montana, with a membership of about 4000. They pay weekly benefits of from \$6 to \$10 for sickness or disability; four pay a small amount in case of death or total disability.

CALIFORNIA manufacturers of giant powder are debarred from a profitable market by the Johannesburg monopoly, which secures what appear to be enormous prices. The annual consumption is about 250,000 cases there.

At Malakoff, Nevada Co., Cal., years ago the North Bloomfield M. Co. sunk a shaft 207 feet through gravel before striking bedrock of the channel. It was gold-bearing throughout, yielding from 40 cents to \$2.50 per cubic yard.

SILVER is among metals the best conductor of heat and electricity, its property in that regard decreasing with rise in temperature. Coin silver contains 7 per cent copper. The tarnish caused by sulphur is a thin film of sulphide of silver.

Boston has 1232 electrical lamps to each 1000 inhabitants, New York 859, Chicago 730, San Francisco 660, St. Louis 660, Cincinnati 551, Philadelphia 375, Baltimore 373, Brooklyn 286, Vienna 246, Edinburgh 243, Paris 185, London 184, Berlin 178.

NOTING that the next meeting—the 76th—of the American Institute of Mining Engineers will be held in New York City next February, it is in order to suggest that the following meeting—the 77th—of that organization could with great propriety be held in San Francisco.

"DENOUNCEMENT," in the mining law of Mexico, means that proceeding by which under the law a legal right of possession is obtained to mining property in that republic. The word has no English synonym, but is used by all English-speaking foreigners mining in Mexico.

"REV." JERNEGAN of Middletown, Conn., who induced credulous Boston men to put \$300,000 in his hands "to extract gold from sea water," has proffered from Brussels, Belgium, to disgorge \$75,000 if the Massachusetts men will let him come back to the United States and enjoy the remainder in peace and comfort.

WATER is at its greatest density at 39.1° Fahr. If heated from 30° Fahr. to that temperature it contracts, then expands until at 46° Fahr. it has the same volume as at the freezing point—32° Fahr. Heated to 212° Fahr., it expands .0465 of its volume at 32° Fahr. The volume increases in a greater ratio than the temperature.

TO FIND "the actual rate of expansion in the first cylinder of a compound engine," divide the period of admission, plus the clearance, with the length of stroke, plus the clearance. That is: suppose cut-off at one-fifth, and clearances at one end equal to one-twentieth the piston displacement, then 1.05 divided by .25 equals 4.2.

MINERALOGICAL information as to the Philippines is meager. Recent inquirers are referred to the issue of Nov. 26, which contained advance sheets of Prof. Becker's forthcoming official report thereon. A Philippine exploring expedition was recently projected in San Francisco. Geographically speaking, there is considerable room for such an organization.

The minimum interval of rest which can be allowed in the operation of stamps in a stamp mill is one-tenth of a second. With a 1-in. drop a stamp will occupy .073 sec. in dropping; with a 2-in. drop it takes .11 sec.; 3-in., .134 sec.; 4-in., .154; 5-in., .174; 6-in., .19; 7-in., .206; 8-in., .22; 9-in., .233. With a cam-lift of 7 in., 90 drops per minute, the time of the lift is .297 sec.; of the lift and drop together, .667 sec.

In 1884 a 50 K. W. dynamo was considered a large machine, while a 100 K. W. Edison steam dynamo was justly called a "Jumbo." At the present time the largest size of generator built or building is of 4600 K. W. capacity. The price of dynamos sixteen years ago was about 20 cents per watt of output; dynamos of similar running speed in comparatively small sizes without switchboards now cost about 2 cents per watt.

SAM'L NEWHOUSE of the Utah Con. G. M. Ltd. claims that he has 750,000 tons ore in sight, sufficient to keep his 200-ton smelter running for the next twelve or fifteen years. The

formation is quartzite and limestone, alternating; the oxidized ore contains silica, 8%; iron, 15%; copper, a little gold and about 2½ oz. silver to the ton. There are no shafts; the mining is all done through tunnels; he says he can drive a timbered tunnel 400½ ft. for \$8 per linear foot, and can mine and deliver ore at the tunnel's mouth for \$1.35 per ton.

This native alloy sent is similar to that found in the black sand and sea beach gold at Gold Bluff, Port Orford, and other places on the California and Oregon coast. It occurs in thin scales about one-fiftieth of an inch in diameter, resembling nickel in color. It is strongly magnetic. Its specific gravity is 18. It is composed in 100 parts: of platinum, 48; osmioridium, 44; iron, 6; indeterminate, 2. So far as known, it has not as yet been discovered in place. A Washington man recently wrote that he had "a ledge" of it, but that is extremely doubtful.

The initials "E. M. F." form an abbreviation for electro-motive force, which may be briefly defined as anything that produces or tends to produce an electrical flow, including all such agencies. For instance, when copper and zinc plates are immersed in dilute sulphuric acid the copper becomes positive and the zinc negative. An E. M. F. is created, tending to carry electricity across the liquid from the zinc to the copper. An "ohm" is the resistance offered to the electric flow by a copper wire one-twenty-fifth of an inch in diameter and 150 feet in length.

The illustrated little article on page 635 on "A Home-Made Dynamite Thawer" is a good example of correspondence. The New Mexico subscriber sent a rough sketch, embodying the idea, which our engraver redraw as published. A sketch or drawing, however crude, is always of value as in no way can a better idea be secured of any device. In this particular case it is in order to say that the Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo., furnish a simple and excellent device for thawing powder, though the apparatus illustrated and described by Mr. Sanders would be of value to many an isolated miner.

SEC. 2339, Revised Statutes U. S., says: Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes have vested and accrued, and the same are recognized and acknowledged by the local customs, laws and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes herein specified is acknowledged and confirmed. But whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

This week's rains were a Godsend to the California miner. Not since '51 was there so long-continued a drought, and every miner hopes it will be forty-seven years more before there will be so serious a cessation of mining. To illustrate recent existing conditions is published an excerpt from a press dispatch dated Dec. 20th, from a section of the State that because of its situation in the foothill region is ordinarily exempt from inconvenience: "The town of Forest Hill, the center of the mining region, has been in need of water even for drinking purposes, and but a few weeks ago, during a fire at that place, giant powder was resorted to, to save the entire town from destruction. Never in its history has this mining section suffered so for water, and never was the outlook brighter for a large output of gold in 1899 if backed up by a wet winter."

At Savonas, B. C., is the only producing quicksilver mine, so far as known, under the British flag. In the United States, California is the only State producing quicksilver in commercial quantities. Recent correspondence with this paper has indicated cinnabar finds in Arizona, Washington and Oregon. In the daily papers of the 20th inst. appears an absurd "dispatch" of the discovery of a "mountain" of cinnabar in Lake Co., Or., through which three tunnels have been run, "all through pure cinnabar ore!" The discovery was made by "farmers" mining the adjacent farm land, who sold the "mountain" to Tacoma, Wash., men, who say they will "erect a smelter and monthly ship 800 flasks." The shipments will be "to New York in car load lots." Inspirers of such silly statements fail to grasp the force of understatement or the weakness of exaggeration.

RAT PORTAGE, Ontario, does not propose to be behind in early announcement of "great gold strikes;" but not desiring to wait for the slower process of the mails, sends by special telegraph a "press dispatch," dated at Winnipeg, the day prior to its appearance in sundry newspapers, an alleged find of gold ore "filling a slope 40 ft. high, 2½ ft. wide." The ore is "on a conservative estimate worth from \$25,000 to \$35,000 per ton in free-milling gold." Another estimate, equally "conservative," figures "\$250,000 now in sight." The vein, it appears, is "11 ft. wide; its length and breadth not yet determined." Some time ago the leading advertising agency in the United States widely advertised its ability to secure publication of "anything" marked "by telegraph," and having the appearance of a genuine news item, in daily newspapers—if the financial inducements were sufficient.

REGARDING the fullers' earth recently discovered at Famosa, Kern Co., Cal., in general, is a clay-like substance, which has the property of decolorizing or clarifying oils. An ultimate chemical analysis shows it to differ from most ordinary clays in having usually a high percentage of combined water and a low amount of alumina. There is probably a large amount of hydrous silica present. Fullers' earth possesses little or no plasticity, and in order to work properly has to be ground very fine. A chemical analysis is of little value at present in determining its quality; only a practical test suffices. Up to about three years ago all of the fullers' earth used in this country was imported from England; deposits have since been discovered in Florida. Next to the Florida deposits of fullers' earth, those of South Dakota are the most extensive thus far discovered in this country. The Kern Co. deposits are being tested preparatory to extensive development work if conditions warrant.

The late decision of the United States Supreme Court in the case of the Enterprise Mining Company vs. Rico-Aspen Consolidated Mining Company (Colorado) affirms the right of tunnel companies to locate on veins which they may encounter, and, to a certain extent, the Colorado State law with regard to tunnel claims is practically set aside. The following is quoted from the decision: "The discovery in the tunnel is like a discovery on the surface. Until one is made there is no right to locate a claim in respect to the vein, and the time to determine where and how it shall be located arises only upon

the discovery whether such discovery be made in the surface or in the tunnel. We hold, therefore, that the right to a vein discovered in the tunnel dates, by relation, back to the time of the location of the tunnel site, and also that the right of locating the claim to a vein arises upon its discovery in the tunnel, and may be exercised by locating that claim the full length of 1500 feet on either side of the tunnel, or in such proportion thereof on either side as the locator may desire."

CONCERNING the character of the auriferous wall rocks of gold quartz veins, practical research makes it seem true in most cases for deep mines, that the gold in the walls is contained in the sulphurets; that it is of smaller fineness than the vein gold; that the sulphurets are pyrites; and that gold and sulphurets diminish rapidly in quantity as the distance from the vein increases. Sometimes the wall rock pyrite is almost barren. There appear to be two sorts of wall pyrite, one the result of the action, on ferro-magnesian silicates, of the sulphides of hydrogen or of the alkalis; this variety is sometimes almost worthless. There are other impregnations of pyrite which seem to have permeated from the vein fissures, in solution, as double sulphides of the alkalis and iron. Solutions of alkaline carbonates, partially charged with hydrogen sulphide, will take up notable quantities of many sulphurets, and also of gold. Wall rocks appear to be much more permeable by solutions of some substances than by those of others. Native gold, quartz and all the sulphurets excepting pyrite, are for the most part retained in the veins, while carbonates seem to penetrate freely into the wall rock. This indicates an osmotic separation of the metal-bearing solution. That some undecomposed rocks (granite, andesite), contain free gold in clearly visible particles appears to be quite certain. There is also strong evidence for the strange hypothesis that some sulphurets in massive rocks are original constituents. It is believed that some eruptive rocks associated with veins are truly metalliferous. Nevertheless, the possibility presents itself that in such cases vein and rock each derived its metallic contents from a common source, miles beneath the surface. Such an hypothesis is not without difficulties of its own, but accords better with the osmotic phenomena than the theory of derivation from wall rock.

In California the right to the use of running water flowing in a river or stream, or down a canyon or ravine, may be acquired by appropriation. This must be for some useful or beneficial purpose, and when the appropriator or his successor in interest ceases to use it for such a purpose, the right ceases. The person entitled to the use may change the place of diversion, if others are not injured by such change, and may extend the ditch, flume, pipe or aqueduct by which the diversion is made to places beyond the first use. The water appropriated may be turned into the channel of another stream and mingled with its water, and then reclaimed; but in reclaiming it the water already appropriated by another must not be eliminated. A person desiring to appropriate must post a notice in writing, in a conspicuous place at the point of intended diversion, stating therein: First, that he claims the water there flowing to the extent of (giving the number) inches, measured under a 4-lb. pressure; second, the purposes for which he claims it, and place of intended use; third, the means by which he intends to divert it and the size of the flume, ditch, pipe or aqueduct in which he intends to divert it. A copy of the notice, within ten days after it is posted, must be recorded in the recorder's office of the county in which it is posted. Within sixty days after the notice is posted the claimant must commence the excavation or construction of the works in which he intends to divert the water, and must prosecute the work diligently and uninterruptedly until completion, unless temporarily interrupted by snow or rain. Completion means conducting the water to the place of intended use. By a compliance with the above the claimant's right to the use of the water relates back to the time the notice was posted, but a failure deprives the claimant of the right as against a subsequent claimant who complies.

METALS differ widely in their behavior under the cutting tool. Some, like iron or steel, require a slow speed and light feed, a tool shaped differently from that used for other metals, and usually oil must be applied to the work in order to obtain a free cut. Others, like cast iron, are worked with a speed somewhat higher, and a cut considerably heavier than that employed for iron or steel, and commonly no oil is applied, while others cannot only be cut without oil, but the speed can be very high. An example of this last class is brass, an alloy employed in the arts for purposes demanding a free-working material possessing moderate strength. The name "brass," however, is a term of considerable latitude. It is generally associated with a material of excellent cutting qualities, but the variation is great in this respect. As a rule, the lower the brass the more difficult it is to cut. As the composition approaches pure copper it becomes, like this metal, one of the most troublesome substances known to machine. If the alloy is made from pure copper and spelter (zinc), the result is a material wholly unsuited for certain uses; its chips are long and tenacious; a slower speed must be employed in cutting, and even oil must be applied in many instances. If drilled at a high speed, the drill is liable to become drawn in and broken, and a burr is left on the reverse side which requires extra treatment to remove. If employed in an automatic machine, such as a screw machine, the chips are liable to obstruct the mechanism. In filing, the file soon becomes clogged with particles of metal, which abrade the work in grooves difficult to obliterate. For certain classes of work, such as spinning or cartridge brass, these qualities are essential; but for others, like clock brass or screw rod, they are almost prohibitory. Practice has decided that for the latter purpose all elements of a refractory nature shall be removed, and an alloy produced which can be worked free at a high speed. The difficulty can be partially overcome by making an alloy which will give short chips, but an alloy of this description must still possess sufficient ductility to roll and draw. The methods of making such an alloy are as follows: 1. By making the brass very high, say, not below copper, 55, and zinc, 45 per cent. Such a mixture could be broken down hot, but even then would be unsuitable on account of its hardness and difficulty of rolling or drawing. The chips of the alloy are fairly short, but the speed of working would have to be slow, on account of the hardness. 2. By the addition of tin. Tin, even in small quantities, hardens brass and gives a metal similar to that proposed in the first case. The chips are short if the content of tin is sufficient, but the hardness is too great for a high speed. 3. By the addition of lead. This method of producing free-working brass is now practiced in all the brass manufacturing establishments in the world.

How to Set a Wood-Consuming Boiler.

In the issue of Nov. 19th appeared an article on "Horizontal Tubular Boiler," treating of the merits of the type, its setting, coal consumption, etc. Much of the surface loss, noted by Rankine, is due to reflection and the slight internal loss to a laminated condition of plates. Appearance of such articles upon boilers and methods of setting in relation to economic coal consumption is not infrequent, and it is thought that a similar article relating to the best methods for wood might be of practical value. There are many wood-consuming boilers. Their use require, in some essentials, a setting different from that for coal. The subject as here presented relates to setting for wood consumption by the same type, *e. g.*, the horizontal tubular boiler set in masonry.

In setting of a boiler for wood, it should be underlaid with a continuous curved flooring of permanent material, as brick and mortar, made uniform and smooth as possible, laid eccentric to the boiler, deepest at the bottom center and carried up on the ma-

sonry walls and terminating in O, having a space between it and boiler at that point or line extending through its length of from 1½" to 2", depending upon the size and length of boiler, the larger and longer requiring the more space.

The throating should be done at the rear end, where the cross-sectional area of the opening should be about three fourths that of the corresponding area of tubes. In building this flooring forward it should continuously drop down by a uniform incline to the point where it meets the incline from rear end of grate bars, the amount of drop and consequent increased space again depending upon size and length of boiler, say with a 4' diameter boiler 20' long a difference of 3" between the two points. From this indicated point to the top rear end of grate bars should be laid a smooth incline, which should end at O at the bars and be continued up on the sides to a harmonious union with above described flooring. The practice of laying masonry in steps under boilers is pernicious, as are all abrupt angles. The pitch of this drop-down incline should not exceed 45° from horizontal, and with a long boiler it may be advantageously carried to 30°, in its giving more directness to the current and less liability to injury of the plate directly above it from overheating.

The grate bars should be covered across their front to about one-quarter of their length back with plate iron or some stable incombustible substance which will prevent the passage of air.

The only ash pit, except the one under the grate bars, should be the return chamber at the rear end, and that should have no more extension beyond the end of boiler than is requisite for the care of boiler.

Of course, every engineer knows that the end sought, in setting boilers, is to obtain as perfect combustion as possible, but all do not seem to realize that it is essential that the heat obtained should be continued in unbroken contact with the boiler until a

transference to the water is effected, instead of being allowed to wander around in broken space and exhaust itself.

By this method of setting the draft is greatly increased, so much as, even after reducing the air-admitting surface of grate bars, the necessary air for combustion will need be regulated in its admission under the bars; but the covering of the bars has an important independent function, as will appear further along.

With the ordinary setting the conditions of combustion and the method of firing combine to the effecting of most of the combustion toward and at the rear end of fire box, or chamber, the fuel being continuously fed back to the rear, leaving an open space between the fuel and fire front, in which there is no combustion, in fact, nothing to burn. Cold air in excess passes up through this opening, among the fuel, and a large surplus over it, just where it should not be, thus disturbing and checking combustion. With this described modification the firing should be maintained well to the front. Coals will accumulate upon the plate, a uniform destruction of the fuel will obtain, and a uniform combustion follow. Any free air required for combustion farther back passes under the fire, over the hot coals and ashes of the

ash pit to the rear, thence up and along the floor, between it and the flame, and so continues along until required for combustion, without disturbance to the flame, which is thus continued, undisturbed and unbroken, against the boiler, and any surplus will so pass on into the tubes.

This method heats the fire front and doors more than the usual practice, but can be largely provided against by lining and filling in between with non-conducting material.

The practice of carrying water in the ash pan or pit is objectionable, in that it involves heat which would otherwise be available for generating steam, besides which it generates steam which is of questionable utility, as against air, under the boiler.

To summarize, the results obtained by this method are: increased draft, more uniform combustion, avoidance of introduction of surplus free air among and over the fuel, introduction of the requisite free air beneath and in the rear of the fuel, the continued separate movement of the carbon and oxygen until ready for combustion, the effecting of so perfect combustion in the furnace and under the boiler that little heat passes to the stack—so little that one can rest his hand upon the bonnet without being burned; all of which, when concentrated, means a considerable saving in fuel.

Imperfect combustion means, for one thing, a deposit of solid carbon upon the boiler surfaces, and it being almost a non-conductor, while remaining on deposit greatly impedes the transmission of heat, and if it occurs far back, as in the tubes, the probability is that it will remain as a permanent deposit until mechanically removed.

In construction the introduction into boilers of tubes too small to carry the elements of combustion in sufficient amount as to allow of, and maintain it through their entire length when requisite should be avoided; the longer the tubes the larger they must

be to enable this, some tubes introduced being so small as to choke out combustion.

It is noticeable that ample cross-sectional area of tubes effects an economy in fuel.

NOTE.—If the law governing the wave lengths of sound vibration equally applies to heat, vibration not in harmony will strike down each other through interference. Hence the importance of holding them in close contact with the body which we wish to receive their impulse.

Black Oak Group of Mines, Tuolumne Co., Cal.

From a Special Correspondent.

The Black Oak group of mines is on the east belt, Soulsbyville mining district, Tuolumne Co., Cal. General formation: grano-diorite, granite-hornblende, porphyritic-granite, gneiss, quartzite and slate, with diorite and diabase dykes intersecting and paralleling the veins. The group comprises Black Oak, Carra, Live Oak and White Oak. The latter is a westerly vein. The main shaft is 750 feet on the incline, 525 feet vertical from surface; seven levels are opened from shaft; average length, 600 feet. The vein averages 6 feet. There is an unbroken shoot, 500 feet in length. Owing to the solidity of the walls, very little timber is required to hold the ground. There being gouges or selvages on both walls, the rock breaks free. The average value of the rock is \$20 in free gold, as worked in their mill; as raised from shaft, the ore is assorted; the high-grade sulphuret ore and concentrates are shipped to Selby's, San Francisco. South of Black Oak mine, in the Carra and Live Oak, similar shoots are found determined by prospect shafts.

The machinery and plant consist of water and auxiliary steam power. The water is conveyed through 16-inch iron pipes from ditch and reservoir, giving 500 feet pressure to the Pelton water wheels, of which there are several. The main wheel is 16 feet in diameter, driving by direct action, from main shaft of wheel, a seven-drill Rix compressor of double cylinder construction. This wheel is set in the center between cylinders, making unnecessary any belting, gear or pulleys. The main working shaft has a one-ton skip and two 10-inch plunger pumps. The machinery is connected with a Cornish bob-gear, capable of sinking 2000 feet. Steam power can be readily attached. The steam plant consists of two 150 H. P. boilers and a compound 100 H. P. engine for pumping. For hoisting there is a 50 H. P. engine, which runs an eight-drill Norwalk compressor. Water for power can be had nine months in the year. The mill has twenty 900-pound stamps, twelve Frue concentrators, run by water power, under a 500-foot head. At tail of concentrators is a Morris canvas plant, 103 feet long, 50 feet wide; this catches the fine sulphurets. Below the canvas tables is the cyanide plant. There are two agitators for treating high-grade pulp, five tons capacity each every twenty-four hours, and a leaching plant to treat tailings of fifty tons capacity.

The ore hoisted from the mine is taken to the sampling house, assorted and the high-grade sacked and shipped to San Francisco. The second grade is passed into the mill. The pulp, after leaving the batteries, is sized, the finest being diverted to one set of concentrators, the coarse to another set, each set of concentrators being operated by separate power. The slimes and coarse sand are run over the canvas tables separately; thence are conveyed to the leaching plant and subjected to the cyanide treatment in different vats, so that they are still kept separate. Experiments have here demonstrated that more profitable extraction can be made in this way, a weak solution of cyanide being used in the vats. From the batteries to the tail of cyanide plant an extraction of 90 per cent is made.

The whole of this property was brought to its present state of efficiency and paying condition by Messrs. Scott, Dowe & Co., the owners, with W. P. Scott as superintendent since its inception.

MILL NO. 1, BLACK OAK MINE, TUOLUMNE CO., CAL.

VEIN IN 750-FOOT LEVEL, BLACK OAK MINE, TUOLUMNE CO., CAL.

Economizing Water in Concentration.

At a recent meeting of the Chemical and Metallurgical Society of South Africa, as reported in its Journal, E. H. Johnson read a practical paper on "A Means of Economizing Water in Concentration," in which he stated that the apparatus—the (drawings of which are herewith reproduced), was designed with the object of obtaining a concentrate suitable for cyaniding, in which the only water used should be that with which the ore had been crushed and which carried the pulp leaving the mill to the collecting vats of the cyanide works. He said he was led to depart from the usual Spitzlute practice and seek other means of effecting classification on account of there being no water available for hydraulic classification as ordinarily practised, and as these fields are not over-well supplied with water generally, he brought this device to notice in the hope that the information may, perhaps, be of value to others who may be similarly placed.

Little explanation of the method of working the apparatus is needed. Briefly, the apparatus consists of two similar boxes in which the pulp from an 80-stamp mill is distributed over a width of 7 feet, causing a reduced flow. Near the entrance of the pulp two weirs are formed by the periodic addition of pieces of wood 3 inches by 3 inches square. These serve to break the force of the flow of pulp, and are always kept a little higher than the bed of accumulating concentrates. The end of the box is similarly built up by $\frac{1}{2}$ -inch laths as the concentrates accumulate. The boxes are used alternately, the one being discharged while the other is filling, each box holding a day's product. Bottom discharge doors of simple design are fitted to the boxes, which are elevated on trestle work, enabling trucks to be run underneath which convey the product to the storage vats. Mr. Johnson's experience was that although it is necessary to employ white men to attend to the boxes, the expense does not exceed the pumping charges where spitzlute are used. Attendance on the collecting vats is also performed by the same men. Everything being open there is no possibility of choking or other temporary failure in the working of the boxes. They have been working now continuously for five months—the only stoppages being due to the ordinary occasional stoppage of the mill. The average product for the five months' run has been equal to 10.5 per cent of the gross quantity of tailings, producing a concentrate of 18.5 dwts. per ton value. The average value of the tailings entering the boxes has been 4.7 dwts., the value of the tailings leaving being 3.25 dwts. per ton or 30.8 per cent of the gold is obtained in 10.5 per cent of the sands. The

dimensions given on the drawings are of those constructed for taking the product of an 80-stamp mill, which might need modification for mills of other capacities.

The recent scarcity of water on this coast lends interest to the matter.

The Mount Morgan Gold Mine.*

By EDGAR HALL.

Like all the truly great, the mine will be found very modest, and will deprecate being placed on a pedestal apart from other mines as to quote a recent magazine article, a "geological puzzle, the despair of scientists."

The mine has not been described very often by men competent to read it aright, or to see its features accurately. Some scientific accounts of the ore deposits are comprised in the three reports of R. L. Jack, the Government Geologist of Queensland.

Mr. Jack's first report is well known. Not much work had been done at the mine when it was written, and the author's personal experience of ore deposits was not then so extensive as it is now. It contains the famous Geyser theory. In it Mr. Jack allowed reins to his imagination in a way he has never since done. The simplicity of its story and its graphic portrayal of the author's theory make the first report as readable and attractive to the imagination as any fairy tale of science can be. As an example of imaginative writing by a man ordinarily the most careful and cautious of Australian geologists, it has high value. Unfortunately, it has little else. This report was the starting point of the marvelous tales of the mine which ran round the world.

In fact, the Mt. Morgan ores, far from being peculiar to it, are found in conjunction with huge pyrites deposits all over the world, and are a feature of those deposits, and there is nothing whatever unusual about them except the quantity of gold they contain. The development of the mine has shown that big pyrites bodies are present at Mt. Morgan, and that a portion of them, at least, is in such a state of crystallization that it disintegrates and decomposes with remarkable ease and speed.

Thus, the opinion of those in charge of the mine at first, that the deposit was the cap of an immense pyrite lode, has been proved correct. But whether these pyrites bodies are lodes or not is another question, and how they were formed is another. It is certain that they differ in a marked degree from ordinary quartz lodes, and there are many theories seeking to explain them. The explanation given by Dr. Peters in the *Australian Mining Standard*, when writing of Mt. Lyell in Tasmania, is one of them, and it is far removed from any thermal origin.

What is it, then, that has made Mt. Morgan wonderful, and led to the extraordinary tales about it? It is the peculiarity in mankind that makes them value gold, the heavy, bright, yellow metal possessing no useful quality in itself, but whose color and brightness have fascinated men's eyes from the infancy of civilization. No philosopher has yet explained that fascination, though many have inveighed against it. There are plenty of other metals quite as rare and quite as wonderful from the point of view of nature as gold, but nobody troubles to invent explanations of why they form in some places the 16,000th part of the rock instead of the 48,000th part or even some smaller proportion.

The chemist, when he comes to those small proportions, dismisses them briefly in the words "a trace," and the man who would write long papers about their minute presence would be set down a fool and get no readers. But gold has fascinated all men, and in its presence the usually cool man of science loses his head and begins to look for some special and extraordinary reason of Mother Nature's for putting it where it is.

Nature has no special reasons; she treats all her children impartially alike, and causes which operate to produce one element in one place operate similarly to produce another element in another place. The difference lies in men's minds and not in Nature's.

The Mt. Morgan gold mine is no "geological puzzle, the despair of scientists," but a simple result of the climatic conditions prevailing in the Queensland locality in which it is situated, and the extent of superficial deposits is evidence of the long continuance of similar climatic conditions to those now obtaining.

Those conditions were assisted in their decomposing effects upon the huge pyrites deposit by the fact that at one time the deposit had been intersected by dykes of dolerite, an igneous material which rapidly decomposes under atmospheric influences.

Dolerite and pyrites decompose rapidly enough when separate; but standing side by side they help each other, the acid products of the pyrites acting powerfully upon the basic dolerites, and thus was produced "surface decomposition of more than ordinary intensity," and the products of that extra rapid decomposition formed the ever-varying mixtures of material which once covered the crest of Mt. Morgan.

*Condensed.

Mineral Lode Locations in British Columbia.*

By WILLIAM BRADEN.

In view of the current discussion of a proposed change in the United States mining law, abolishing the feature known as the extralateral right of a lode location, it is an interesting circumstance that in the neighboring province of British Columbia this feature was tried for eight years and then abandoned. The results of that abandonment have been such as to disprove the proposition, so confidently advanced by many writers, that there is something in the nature of the mineral deposits of the Pacific coast which requires the grant of the extralateral right to mining locators. In abolishing this peculiar privilege, British Columbia has followed the example of all civilized countries except our own.

From 1884 to 1892 the mineral act of this province was modeled after that of the United States, and authorized lode locations 1500 feet long by 600 feet wide, carrying the extralateral right. But it was soon realized that, however equitable in intention, this principle was so liable to complications in application and such an endless source of litigation as to be a greater injury than aid in mining. The act was consequently revised in 1891, and since the end of that year the provincial lode law is in force. The manner is indicated in the diagram marked No. 1 and No. 2, placed on the boundary, and as nearly as possible on the vein. The distance between these two posts, known as the "location lines," must not exceed 1500 feet, and the course must be plainly marked by blazing trees or otherwise. Upon the two posts must be written the name of the claim, the name of the locator, and the date of the location. In addition to the foregoing, upon No. 1 post must be written "Initial Post," the approximate compass bearing to No. 2 post, and the number of feet of the claim lying to the right and left of the "location line." The locator must place a post marked "Discovery Post" where rock has been found in place. The four diagrams of Fig. 1 show the elasticity allowed in locating claims.

Within fifteen days after the location of a claim it must be recorded with the mining recorder of the district in which the claim is situated. To hold such a claim, after location and record as above, in each year from the date of recording \$100 worth of work must be performed and recorded, or in lieu thereof \$100 must be deposited with the mining recorder. Any free miner or company owning adjoining claims may perform the annual assessment work for all such claims on any one or more.

After \$500 worth of work has been performed (including \$100 for the survey of the claim) a "Certificate of Improvements" may be applied for, and after sixty days' advertising, in case no adverse claim is filed, the said certificate is allowed. Titles acquired between 1884 and 1892 cannot now be deprived of the vested extralateral right they have secured. As an illustration of the complications thus created, Fig. 2, showing a group of claims in the Slokan district, West Kootenay, B. C., is presented. Of the locations in this group, the Last Chance, World's Fair, Bonanza King, Crown Point, Treasure Vault, Ajax, Chicago and R. E. Lee were all located prior to the revision of the mining law, and consequently have extralateral rights, the boundaries of which must depend upon mining developments, conflicting testimony, expert opinions, jury verdicts and judicial rulings. After that revision the American Boy, Starlight No. 3, Duluth, Minneapolis, Erie (location lines not shown in the drawing), Rushford, Marlboro, Shunia, Random Shot and Ajax Fraction were located in the order, as to date, in which they are here named.

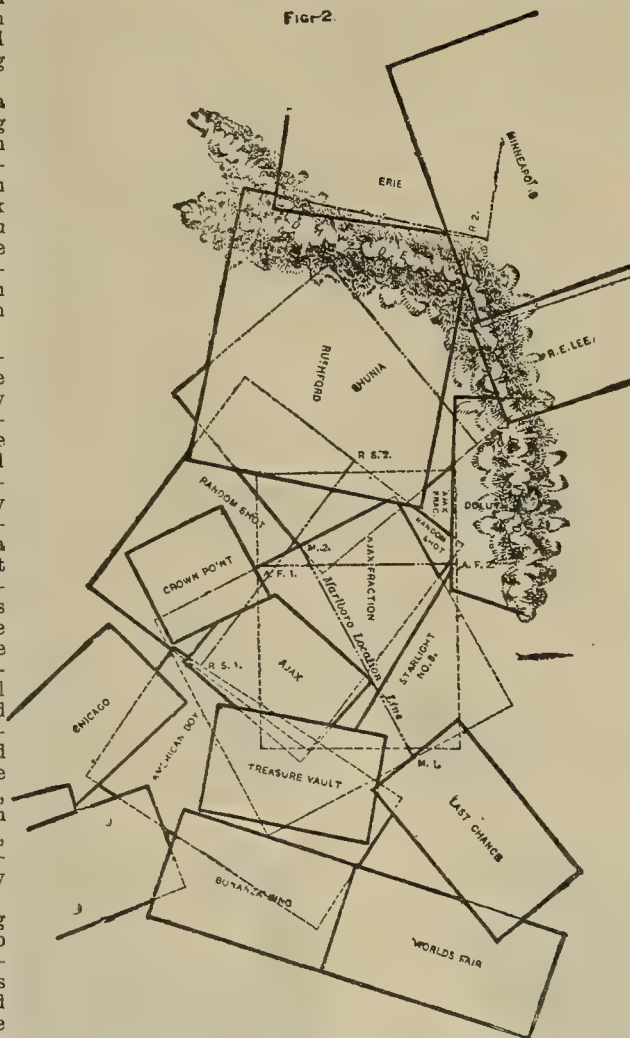

The Marlboro is no longer an existing claim, title having lapsed through failure to perform assessment work. The Ajax Fraction was located subsequently to cover this ground. The Marlboro having been located before the Shunia and Random Shot, the Ajax Fraction, though a later location than either of these, takes such parts of their claims as conflicted with the Marlboro. This proposition may sound strange to American ears; but the explanation is simple. All these claims were located after the abolition of the extralateral right; consequently their rights are confined within vertical planes through the boundaries of the surface actually appropriated. The Shunia and Random Shot locations having been, ignorantly or otherwise, so made as to overlap the Marlboro, their locations were entirely void as to the areas thus overlapping; and upon the lapse of the Marlboro title the whole of the Marlboro ground reverted to the public domain, and was

open to a new location, unaffected by the imaginary boundaries of earlier claims.

The Rushford, having been located before the Marlboro, takes all the area within its normal boundaries except the parts covered by the Minneapolis and Erie, which are still older. It will be seen that from these conditions no disputes as to title can possibly arise under the mining law which simple surveys and reference to dates upon record cannot settle. The situation presents no greater complex-

Fig. 2

Scale 900 feet = 1 inch.

ity than a similar division of agricultural land.

Suppose, however, that each of these claims had an extralateral right, like those lying further east in the group. The lode lines of the Shunia (S 1, S 2), Random Shot (R S 1, R S 2), Ajax Fraction (A F 1, A F 2), etc., indicate lodes of widely different courses, and the resulting extralateral rights would be inextricably confused.

No doubt trouble may hereafter arise in this district, in which some claims were located under the old law and others under the new, but the confusion cannot be as great as if they were all in the former category, and, apart from such local conflicts the present system will satisfactorily prevent fresh oc-

casions of controversy, and, in new districts, will work out, unhindered, most satisfactory results.

The simplicity of this system is its chief excellence. Difficulties of interpretation are entirely done away. In the complex cases of cross veins, blind veins, faulted veins, uniting veins, or other irregular deposits, the rights of the miner are clearly defined. The liberality with which he is allowed to make his surface location, with the vein anywhere within it conformable to one of the location lines (see Fig. 1), gives him every incentive to a careful preliminary exploration of the real strike and dip of the vein, and rewards his industry and skill in this respect with a grant which goes far to compensate him—in fact, in most cases, more than compensates him—for the loss of the delusive, indefinite and precarious extralateral right.

There is a tendency to perpetual small amendments of the law which works much temporary annoyance. After nearly every concession of the provincial legislature new rules are promulgated. The unnecessary annoyance of such frequent changes is an evil which should be avoided. So far as possible, changes in a mining code should be thoroughly considered by experts, and being found advisable, should be made final. The experimental manufacture of mining laws is emphatically to be deprecated. This principle should be borne in mind in any revision of the United States law, whether radical or partial.

Electrolysis of Cast-Iron Pipes.

As in San Francisco and other coast cities, so elsewhere throughout the country, the extent of electrolysis in piping has been a constant and menacing problem. Suit has recently been brought in the city of Atlanta, Georgia, to determine the responsibility for damage to pipes caused by the proximity of electric underground wires. H. P. Brown, an engineer, before the Municipal Improvement Association, had the following to say regarding electrolysis of cast-iron pipes:

The immunity of cast-iron pipes from electrolytic action has generally been accepted, although it was known that lead and wrought-iron pipes could be and were affected within a radius of half a mile from the power house. But recently some cast-iron pipes were found to be badly corroded underneath the covering of black paint. Seemingly they were in fair condition, but in scraping away the paint, the pipe could easily be cut with a knife. Sections of the pipe were removed and tested. Under the electrical test it was found that at a distance of one and one-half to two miles from the power house the pipes were positive to the rails and therefore susceptible to corrosion. In the town itself the highest voltage observed was four and one-half, but near the power house the voltage rose to nine, and the area of danger extended in one direction for three-quarters of a mile. Usually, the sand that adheres to the pipe and the coating of tar that it receives, protect it from electrolytic action, and in ordinary soils the layer of oxide of iron, formed by the action of the current, being a poor conductor of electricity, also helps to prevent corrosion. Mr. Brown points out that tar is not a sufficient protection for cast-iron pipe, as under the action of the current it is changed into a material resembling graphite and is an excellent conductor. He has observed that in the vicinity of pipes which have been corroded the stones and pebbles are actually coated with a thin layer of metallic iron, a new circumstance in the history of such cases. A chemical analysis of the corroded pipe showed that the percentage of carbon was more than doubled. In other words, the iron was removed and the carbon left. He thinks that the corrosion was due to the presence of carbonate and chloride of sodium in the soil, the passage of the current decomposing them with the formation of muriatic acid, which at once eats into the pipe and ultimately destroys it, without to any great extent altering the outside appearance of the pipe.

He then sought to determine the amount of electrical pressure necessary to injure the pipe. Starting with a maximum pressure of three volts he found that the graphite coating did not exceed the $\frac{1}{32}$ of an inch in thickness, and the iron was practically unaffected. Above three volts the thickness of the graphite layer increases with the length of time during which the pipe is exposed to the current, and soft spots, varying in depth from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch, can be found. As the voltage increases the corrosion increases, and the damage is directly proportional to the pressure and time of exposure, but is inversely proportional to the distance between the pipe and the rail. Mr. Brown does not say so, but the electrolysis of pipe is largely a matter of proper bonding of the rails. The editor of the *American Manufacturer* says that he was recently shown in Pittsburgh, Pa., a piece of wrought iron pipe that was literally eaten up by electrolytic action. It had been laid about two years and was within 2 feet of the rails and about 300 yards of the power house. Under proper bonding the liability of corrosion is greatly reduced, but is not entirely removed.

* Trans. Am. Inst. Min. Engineers.

Industrial Notes.

—Tacoma, Wash., is exporting lumber to Hamburg, Germany.

—A weekly service will be established between Valparaiso, Panama and Ocas.

—It is now proposed to pay Spain that \$20,000,000 for the Philippines in silver dollars.

—The Santa Fe Co. has decided to build extensive locomotive, car and repair shops at Stockton, Cal.

—The El Beleo Co. has contracted for 200 laborers for work in the mines near Santa Rosalia, in the State of Colima, Mexico.

—At St. Helena, Cal., last week a sale of 5,000,000 gallons of red wine was made to San Francisco dealers at prices ranging from 12½ to 15 cents per gallon.

—Work on the proposed Monterey (Cal.) & Fresno railroad has begun, the first work under way being the building of an 1800-foot wharf at Pacific Grove.

—It is estimated that the acquisition of the Philippines, Cuba and Hawaii will cost the United States \$800,000,000 at the start and \$200,000,000 a year thereafter.

—Victoria, B. C., reports a "boom" in west coast mining. "The Rothschilds" (as usual) have bought properties on Barclay sound. The coal mines at Quatsino are proving valuable.

—The steel bridge building across the Snake river between Vineland, Wash., and Lewiston, Idaho, is to be 1435 feet long and 50 feet above high water. The total cost will be \$110,000.

—Owing to the short hemp crop in Manila, Yucatan expects that the price of henequen will be on the rise. The prediction has been made that the price will shortly go up to \$5505 the arroba.

—Colorado jobbers are pleased with the new tariff published by the Santa Fe. Shippers say that the result will be increase of shipments to points in New Mexico, Arizona and southern California.

—Jas. J. Hill is credited by the Spokane Chronicle with saying that the plans for Spokane's new depot have been drawn. The improvements which the Great Northern will make in that city will approximate \$500,000.

—A Santa Cruz, Cal., powder company has a contract calling for 65,000 kegs of blasting powder, to be used in building a railroad in Oregon. This is said to be the largest single order for blasting powder ever given in this country.

—Regarding the Nicaragua canal, Senator McMillin will have a new bill prepared and substitute it for the Morgan bill. He will demand that the United States put up all the funds to control the canal, and have no side partners.

—The torpedo boat Rowan, built by Moran Bros., Seattle, Wash., last week had her official trial test. During the first hour she maintained an average speed of 27.62 knots an hour, or 31.81 miles—1.62 knots above the contract speed.

—Skagit county is second in the State of Washington in the number of feet of standing timber, according to the report of the United States geological surveyors, having 10,362,422,999 feet. Chehalis is first with 18,579,053,000 feet.

—Montana sent 135,975 head of cattle to the Chicago market during the shipping season of 1898, against 147,972 for the year 1897, 180,335 for 1896 and 235,644 for 1895. This year's shortage is about 12,000 head as compared with last year.

—The Los Angeles, Cal., Herald has positive assurance that the Pacific Coast Steamship Co. has passed into the hands of the Great Northern Railway Co., the object being to bring the Great Northern system into the field as a competitor for California business.

—The Pecos Valley & Northeastern R. R. is pushing the extension of its road from Rowell, N. M., to Amarillo, N. M., to a connection with the Atchison R. R. One hundred and sixty-five miles of the extension have already been completed, leaving only forty miles yet to be built.

—The production of the mines in the Mexican State of Guanajuato rose from \$3,320,098 in 1898 to \$6,974,347 during the year ending July 1, 1898. A number of beneficiating haciendas have been abandoned owing to the fact that miners have found it more profitable to sell their ore.

—At Stockton, Cal., last Saturday, were sold all the appurtenances of the Stanislaus & San Joaquin Co.'s irrigation works for \$27,300. The system cost upward of \$400,000 and includes the dams in the Stanislaus river above Knight's Ferry and the distributing ditches extending throughout the northern part of Stanislaus county and the eastern and southern portion of San Joaquin. There are many thousands of acres under its ditches capable of irrigation.

—Swords have been made out of an aerolite. Some years ago an aerolite fell at Echizenbori, Tokio. Viscount Enomoto bought a piece of iron of which it was composed and named it Tenko-Tetsu (iron fallen from heaven). Recently he cut 1500 monmes (about thirteen pounds) from one lump and had three swords made of it by skilled workmen in the Tokio military arsenal, naming the swords Ruiseito (falling star swords). One of these weapons Viscount Enomoto has presented to the Crown Prince of Japan, while the other two he retains in his own possession.

—Stuart & Merriman, who have had charge of one of the surveying parties of the Nicaragua Canal Commission since Dec. 1, 1897, are in San Francisco en route to Washington City. Mr. Stuart says: "Personally I am a strong advocate of the Lake Nicaragua and San Juan river route. There is another scheme on foot

to follow the San Juan river from Lake Nicaragua east fifty miles to Machucha rapids, and then cut a ditch 102 miles long to Graytown. The latter is an ambitious scheme, and, while it would be a good road, I prefer the lake and river line. The people of Nicaragua want the United States to construct the canal. I found them extremely friendly about the matter."

—Some people in Monterey and San Luis Obispo counties, Cal., suffering temporary destitution because of mistaken judgment in trying to cultivate land fit only for pasturage, have asked for relief, and silly California newspapers print sensational statements about "starvation" in type three inches long. If an improvident farmer in Maryland or Virginia were to call on his neighbors for aid, the fact would hardly warrant proclamation of "starvation" running riot in New Jersey or Connecticut. The great stretch of coast known as California, extending 700 miles north and south, comprises so much area as to render any such local occurrence equally inapplicable.

—The total Puget Sound cargo shipments for the month of November were 31,655,815 feet of lumber and 6,167,640 lath, of which 11,102,698 feet of lumber and 896,440 lath went to foreign countries and 20,553,017 feet of lumber and 5,271,200 lath went coastwise. As compared with November of '97, the total increase for November of this year is 6,000,000 feet of lumber. The gain is in foreign shipments, which show for November of this year over the same period of '97, 7,000,000 feet. The lumber shipments from Washington by rail for the eleven months of '98 reach a total of 161,168,000 feet, as against 114,208,000 feet in the corresponding months of '97. The shipments of shingles in November were 1289 cars, as against 923 cars for the same month of last year.

—The following shows the present area and population of the United States and our possible new possessions:

| Area in sq. miles. | Inhabitants to sq. mile. | Population. | sq. mile. |
|-----------------------|--------------------------|-------------|-----------|
| United States in 1898 | 3,613,127 | 75,000,000 | 21 |
| Porto Rico | 3,500 | 806,708 | 331 |
| Philippines | 114,826 | 9,000,000 | 78 |
| Sulu Islands | 850 | 75,000 | 79 |
| Guam (Lad. Islands) | 120 | 8,561 | 71 |
| Isle of Pines | 1,214 | 2,500 | 2 |
| Cuba | 119,240 | 1,500,000 | 13 |
| Hawaii | 6,740 | 109,000 | 17 |

Porto Rico has ten times the and the Philippines nearly four times the population per square mile that we have in the United States, so that there is very little room for immigrants, and, according to the population test, like New Mexico and Arizona, they are already ready for statehood.

—D. P. Cameron of San Francisco has a contract with the Risdon Iron Works for three dredges to mine the bars of the Sacramento river, Cal. These dredges are to be set on barges, whose hulls will be 70 feet long, 30 feet wide, 5½ feet deep. They will cost \$35,000 each. The dredge buckets are to be armed with blades of manganese steel, capable of cutting through gravel, and also to a depth of 30 inches into the bedrock at the bottom of the river. The buckets will work 60 feet below the surface of the water, bringing up mud, gravel and gold dust into perforated screens of ½-inch steel on board the barges. One of these dredges is now working successfully in Boise basin, Idaho. The timbers for the dredges are being framed. When completed they will be shipped to Oroville, put together and placed in operation. Mr. Cameron expects to operate his dredges next spring.

—The construction work now going on between Robson and Midway, B. C., in building the Columbia & Western extension of the Canadian Pacific Railroad, is on a line of 105 miles in length, and the average cost per mile of construction is \$40,000. There are seven tunnels, nearly all requiring rock borings, which aggregate 5300 feet in length, the estimated cutting being 66,000 cubic yards, or about 200,000 tons of rock. In addition there are extensive rock cuttings in open cuts and on the mountain sides. The first tunnel is 200 feet long; the second is 300 feet long. More than one-third of it has been finished. The third tunnel is 3000 feet long. This will not be completed for nearly a year. Air drills are used in boring it. Hand drills are used in the other tunnels. Another tunnel is 700 feet long. At Greenwood there are two tunnels, each between 300 and 400 feet long. The plans require that each of the above tunnels shall be 16 feet wide, and 21 feet high. This branch will cost \$4,000,000, and it is said to be about the most difficult piece of work ever undertaken for that distance and the most expensive in Canada. There are over 3000 men employed.

—Under date of October 19, Consul McCook writes from Dawson City: "I send herewith the price list of the North American Transportation & Trading Company, giving the prices of necessities in Dawson City the 1st of October. You can not, however, get butter at \$1 per pound at the company's stores, except in 10-pound quantities or over, and then only in case you purchase an entire outfit. The same custom holds good in regard to purchases of condensed milk and sugar. The duty on American goods is so high that almost everything used here comes from Canada and Great Britain. I think if the large companies would adopt the landing certificate methods and get rebates on tinned goods, sugar, and other articles, more American goods would be brought in. I have spoken to several companies on the subject, but so far only two of them have procured landing certificates—the Standard Oil Company and the Alaska Commercial Company. Strange to relate, in this Canadian town and vicinity, with a population of some 20,000 and a transient population of as many more, not a single trading or commercial company is owned by Canadian capital. Every business is oper-

ated by Americans, and the highest prices paid are for American manufactured articles, such as hats, rubber goods, shoes, and cigars. Three companies supply the Yukon river towns. With the increasing population of this region there will be room for more, especially if there are good returns from the American side this winter."

"Home-Made Dynamite Thawer."

TO THE EDITOR:—I enclose a rough sketch of a cheap dynamite thawer that I have made, tried and found to work quite well. It may be of use to some of your readers:

Take an empty 28-gallon whisky barrel, 8 or 10 feet of half or inch pipe and an empty 5-gallon tin oil can, all of which can be had at most

A HOME-MADE DYNAMITE THAWER.

mine camps. Bore a hole near the bottom of the barrel, another one 2 or 4 inches from the top, bend the pipe so that the two ends will go into these holes, then drive the pipe into them water-tight. Cut the lid of the oil can open, leaving the top clear, bend back the lid and put the can into the barrel, leaving it stand 2 or 3 inches above the top of the barrel, and fasten it securely to the barrel; then fill the barrel with water and build a fire at the bend of the pipe. Put the dynamite in the tin, and if ice water is used to start with, in twenty minutes the water will be warm enough to thaw the dynamite; afterwards a smoldering log or two will keep the can at the proper temperature.

Of course this can be elaborated, but there is not much gained by building a fireplace to hold the pipe, as the bend will prevent sparks. Cutting the pipe in suitable lengths and joining them up will do some good, if another piece of pipe is added projecting back from the end away from the fire and plugged, so that by withdrawing the plug the barrel can be emptied when not in use.

I suppose there is no need to explain the reason that the water in the barrel is heated by heating the water in the pipe.

Socorro, N. M.

R. H. SANDERS.

Catalogues Received.

CATALOGUE No. 3, the Connersville Blower Co., Connersville, Ind.; pressure blowers, rotary pumps, gas exhausters and hydraulic motors.

CATALOGUE No. 50, the Jeffrey Manufacturing Co., main office Columbus, O.; an unusually well arranged octavo, 224 pages, indexed and admirably illustrated, with description, details and prices of elevating and conveying machinery, chain belting, steel cable, general supplies for engineers, foundries and machinists. This company has recently added several new lines to their already large line of specialties, viz: Spiral conveyors, illustrated and described on pages 158-162; elevator buckets, pages 170-179; Jeffrey-Columbian separator, bolter and screen, page 46; and Jeffrey Century belt conveyor system, page 39. The catalogue will be mailed on request. The Jeffrey Manufacturing Co. has branch offices at 41 Dey street, New York City; 1325 Monadnock building, Chicago; 202 Main street, Buffalo, N. Y.; 311 Walnut street, Philadelphia; 512 Security building, St. Louis, Mo.; and 844 Equitable building, Denver, Colo.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 13, 1898.

615,805.—CROSSCUT SAW.—J. H. Carse, South Seattle, Wash.
615,808.—RUBBER DAM CLAMP.—A. S. Cooper, McMinville, Or.
615,812.—NECKTIE.—C. W. W. Davies, S. F.
615,851.—STEERING GEAR.—A. Doyle, Seattle, Wash.
615,974.—DAMPENER.—F. E. Fay, Los Angeles, Cal.
615,975.—CLOTHES SMOOTHING.—F. E. Fay, Los Angeles, Cal.
615,980.—RIFLE.—C. F. Gay, Spokane, Wash.
615,719.—DIAL TRAIN FOR WATCHES.—E. Krahenbuhl, San Rafael, Cal.
616,005.—PIPE COUPLING.—A. W. McGahan, Salinas, Cal.
616,031.—FAUCET FILTER.—P. Stone, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Personal.

The address of Prof. Frederic Endlich is sought.

P. R. BRADLEY, Supt. Spanish mine, Washington, Cal., is in San Francisco.

GEO. MAINHART, Supt. Omaha Con. mines, Grass Valley, Cal., is in San Francisco.

H. G. HEFFRON becomes Gen. Mgr. Shoe-bridge Bonanza mine, Silver City, Utah.

A. QUANTIC succeeds L. A. Harris as Gen. Mgr. Revenue mine, Revenue, Montana.

W. H. RADFORD, Supt. La Grange mine, Weaverville, Cal., has returned from San Francisco.

COMMODORE GEORGE W. MELVILLE, engineer-in-chief of the navy, has been elected Pres. of

the American Society of Mechanical Engineers.

CAPT. DE LAMAR has left San Francisco to examine some Central American mining properties.

D. T. DAY of Washington, D. C., and W. E. Barrows of Philadelphia are examining the country for platinum from Harrison gulch to Trinity Center, Cal.

W. M. CHANDLER, a mining engineer, who has been examining mining properties in Russia and Siberia for the Con. Gold Fields Co. of London, is in San Francisco.

G. BAYHA of Redding, Cal., who went to Germany four months since to interview his people concerning the building of a smelter at Stillwater, Cal., has returned, accompanied by a representative of the corporation.

R. P. HOBSON, who sunk an American vessel and raised a Spanish battleship at Santiago, reversing the regular work of the American sailor, leaves San Francisco to-day for Manila, where further distinction awaits him.

R. H. CAMPBELL of Shasta Co., Cal., returns from Horsey, Cariboo, B. C., next week. He has begun sinking a triple compartment shaft 5x15 ft. to tap the ancient river channel there, to be 400 feet deep, costing \$40,000.

PRESIDENT NEFF of the California State Miners' Association has appointed the following: Hon. J. M. Gleaves, chairman; Hon. Charles N. Felton, Hon. E. C. Voorheis, Curtis H. Lindley, J. M. Walling, Mark B. Kerr and E. H. Barton—as a committee to consider the conservation of California waters.

MR. GEORGE H. EVANS will retire from the management of the English syndicate mines in Butte county, Cal., in favor of Mr. Lindsay Scrutton on January 31st, '99. Mr. Evans, although retiring from the active management, will still retain his connection with the syndicate, in reference to the introduction of Californian and other mines on the London markets.

Recently Declared Mining Dividends.

South Swansea, Utah, \$7500; Dec. 21.
Sacramento, Utah, ½ cent per share, \$17,000; payable Jan. 2.
Gold Coin, Colorado, 1 cent per share, \$10,000; payable Dec. 25.
Napa Con. Q. S. M. Co., California, 10 cents per share, and 10 cents per share extra, \$30,000; payable Jan. 2.
New Idria Q. S. M. Co., California, 10 cents regular and 10 cents extra per share, \$20,000; payable Jan. 2.
Etna Con. Q. S. Co., California, 10 cents per share, \$10,000; payable Jan. 2.
The Parrot, Montana, Silver & Copper Co., 3%; payable Jan. 2.
Homestake M. Co., regular monthly dividend of 25 cents for November, also extra dividend of 25 cents; Dec. 24 at the company's office in San Francisco.

Recent Mining Incorporations.

Rio Vista G. M. Co., Sacramento; capital stock \$60,000; H. E. Harvey, J. U. Thompson, C. Rodoni, J. L. Peters, T. Fraser.
South Yuba Placer M. Co., San Jose; capital stock \$25,000, all subscribed; F. W. Campbell, G. W. Campbell, C. Valpey, G. D. Campbell, W. D. Foster.
Pilot M. Co., San Francisco; capital stock \$125,000; subscribed \$250; C. W. Reed, F. W. Jordan, S. Castle, J. Caley, W. Lewis, H. Huff, G. E. Wallace.
Mother Lode M. & E. Co., San Francisco; capital stock \$50,000; P. R. Klein, G. T. Weeks, J. C. Rice, W. A. Cross, G. L. Smith.

Electric Power Development in California.

The following, from the *N. Y. Sun*, though incomplete, and mistaken in regard to the amount of manufacturing in California, is published, to show how those things are looked at through Eastern eyes:

Wonderful things are being done in California in these days in the way of long-distance electrical transmission. Millions of dollars are going into the development of electricity in the mountain canyon streams and the transmission of the electrical energy to the cities and towns in the State. California far excelled the world's best record for the transmission of electricity of a high voltage for a long distance (that made over the Lauffen-Frankfort circuit in Switzerland and Germany) by the famous San Antonio and San Bernardino circuit in Pomona valley, and this season there are four places in the State where the best records so far will be surpassed.

On the Pacific coast, said ex-State Comptroller Phillips, the long-distance transmission of electricity is the greatest thing for the commonwealth since the Pacific railroads were built thirty years ago. Here, where fuel is very dear and consequently motive power is costly, and where labor has been so scarce, the Californians have been obliged to consume manufactured products. Go into any of the stores—no matter of what description—from Mexico to British Columbia and you will find that 95 per cent of all the goods the Pacific coast people buy comes from the other side of the Rocky mountains. Hundreds of merchants tell me that the only articles made in California are overalls and woolen blankets. The greatest financial problem with us has been to manufacture on this coast, and thereby save the tens of millions of dollars paid annually for railroad freight on articles brought 2000 and 3000 miles from the Eastern factories. Many men have lost fortunes in trying to establish shoe, hat, woolen and furniture factories out here, where we have the raw materials in abundance, because the cost of the power to drive the machinery was an obstacle which they could not overcome. The population of the Pacific coast has grown upward of 2,300,000 since 1860; and, with the exception of beet sugar factories, sawmills and railroad shops, there is no manufacturing done on the coast. At last achievements in harnessing the canyon streams and the transmission of electrical power from inaccessible spots in the mountains to centers of our coast population settle the power problem. In a year or two California will have the cheapest, cleanest and most convenient motive power in the Union.

The success of the electrical plant at Folsom, where 2000 H. P. is taken from the American river and sent over copper wires twenty-four miles to Sacramento with very little loss in energy in transmission, opened the eyes of capitalists and civil engineers in California to the possibilities of electrical development on streams on the slopes of the Sierras. It has been reckoned that if all the power in the streams on the western slope of the Sierras from Oregon to San Diego were brought into use by means of electrical inventions, about 280,000 H. P. could be obtained. If the canyon streams in California were thoroughly harnessed by modern electrical achievement, sufficient power could be produced to move every street car, elevator, printing press, threshing machine and mining drill in the State, besides illuminating every building in California.

With the beginning of the new year the boldest and most costly piece of electrical engineering in the country west of Niagara Falls will be practically finished. Its purpose has been to bridge the Santa Ana river, among the San Bernardino mountains, the most turbulent, foaming and powerful stream in southern California. By the bridging of this stream nearly 12,000 H. P. may be taken from the water and sent eighty miles to Los Angeles city, where

it will propel street cars, light and heat houses and run machinery. The enterprise has cost hundreds of thousands of dollars, but the company will be able to sell power cheaper than any steam company in the Eastern States and most water-power companies. For three years the enterprise has been in progress. Miles of tunnels have been blasted through a mountain, two big dams have been built, steel conduits hundreds of feet long have been laid around mountain sides, and tons of electrical machinery have been hauled from Redlands up into the San Bernardino mountains.

Electrical engineers from New York and Chicago say that the most notable fact in the harnessing of the Santa Ana river to do man's work is the transmission of electricity of a high voltage over eighty miles of wire with so little loss of energy. The company finds it can now send electricity of 33,000 volts, having a working efficiency of 4000 H. P., to a distance of eighty-three miles, with a loss of but 10 per cent in voltage. In 1890, when a current of only 8000 volts was sent through the Lauffen-Frankfort circuit in Switzerland for experimental purposes, and there was a loss of only 17 per cent, the feat became noted among electricians and engineers. After doing its work in the production of electrical energy, the mountain stream is gathered into an enormous conduit and led down the mountain side to irrigate the orchards and groves in San Bernardino valley.

The power station in Santa Ana canyon is a small stone building. In it is some of the finest electrical machinery yet made. The water is taken from the river through a canal, flume and tunnel along the side of the canyon, whence it is led into a pipe 2200 feet long, giving what is equivalent to a vertical fall in the water of 750 feet. The wheels are of the impact type, directly connected to the generators, of which there are four, each of 750 K.W. or 1000 H. P. The maximum line potential is 33,000 volts, to which potential the initial voltage will be raised by 250-K.W. step-up transformers. The generators are of an improved three-phase type, revolving field, external armature, and each has a capability of 1000 H. P. and generates electricity at 750 volts. This is conveyed to transformers, of which there are twelve. The current of electricity enters at 750 volts and comes out at 33,000 volts on a line of wire that has no connection with any dynamo.

Another turbulent mountain stream is being harnessed in San Gabriel canyon. Its power will be transmitted to

a half dozen towns, including Pasadena, Monrovia and Azusa, in southern California. It is believed that nearly 3800 H. P. will be had from the San Gabriel canyon stream. Thirty-two tunnels, aggregating 32,000 feet in length, have been bored through the solid granite to lead the stream to a steep grade, where a vertical fall of water may be had. Then 9000 linear feet of wooden and concrete pipe, 42 inches in diameter, has been laid for carrying the stream in bulk to the Pelton water wheels. Thus the canyon water is led some seven miles to the power house. In this distance there is a fall of 486 feet. The principal difficulties met by the engineers in the San Gabriel canyon were the walls of granite, where workmen had to be carried up to their work in baskets fastened to cables, and the conducting of the water after it left the water wheels back into the original channel for irrigating use in the valley twenty miles below.

The mining population in California is watching with interest the work now going forward toward the development of electric power from Kern river, in Kern county, 110 miles north of Los Angeles city. If this enterprise is accomplished, a revolution in mining methods will come quickly. The Kern river is the largest stream in the southern end of the San Joaquin valley. The plant first installed will have turbines developing about 12,000 H. P. at the lowest stage of the river. The situation will permit of further power development to meet increased demands. The company's project includes the construction of a dam at the outlet of an immense natural reservoir site, and by this means the impounding of water to a volume of 42,000 acre feet, the equivalent of 13,721,400,000 gallons. With the Kern River Electric Company's plans brought to successful completion, the Rand gold mining district in Kern county will have 3000 H. P. for use in its mines. All that is now done by steam or compressed air in the mines may then be accomplished by electric power. The drilling, the fanning, hoisting and blasting can be done cheaper and easier and with less danger by electricity. John W. Baker, a mine owner of Sacramento, recently said: "The use of electric power in mining will begin a new era in the industry. The expenses of mining will be cut down so much that poor mines may be worked at a profit, and, besides, the ore can be got out with less work. No one can yet estimate the changes in gold and silver mining that will follow upon the introduction of electricity into the industry."

The electrical power plants at Fol-

som, Pomona and Fresno, in this State, show what electricians may expect from the seven plants in California now coming to completion. All the finished plants have exceeded the expectations of their projectors in the cheapness and convenience of electrical transmission. Something like \$3,600,000 has been invested in such electric plants in this State already. The Californians have a reputation of doing nothing by halves, and it seems not a wild statement that a dozen millions of dollars will be invested in electrical plants along the canyon streams and in copper wire and machinery here in the next few years.

For several months a corps of engineers has been making plans for the development of electric power from the Kaweah river in Tulare county. The engineers' estimate put the total expense of the work at \$800,000. About 1200 H. P. can be obtained and this may be utilized in Tulare, Porterville and other San Joaquin valley towns. Up at Redding, in northern California, under the shadows of Mount Shasta, work on the greatest electrical power plant in America, outside of Niagara, is progressing. New York, San Francisco and Buffalo capital is back of the enterprise, which will cost several millions of dollars.

Near San Diego is one of the most famous of the big irrigation dams of the world—that at Sweetwater, which has stood for ten years. It is proposed to get some 2000 H. P. at the dam and transmit it to San Diego, twenty miles distant. U. S. Grant, Jr., and Jesse Grant, sons of General Grant, are at the head of a company which has the plan in view. Electrical engineers have reported that nowhere can horse power be developed and transmitted cheaper than in San Diego county. There are other great water powers in the San Diego mountains and canyons, and it is believed the Atchison, Topeka & Santa Fe Railroad Co. is interested in having its civil engineers search there for a new power for its locomotives on the southern California division.

A project to harness the waters of the stream in Sanchez canyon, among the Sierras back of Stockton, in the upper part of the San Joaquin valley, is going ahead. Engineers are at work ascertaining what power may be developed there and the best means of conveying it from the mountain streams and waterfalls to Stockton, and possibly to San Francisco. Enough work has been done to show that at least 4000 H. P. may be sent in an electric current from the transformers over several copper wires through the San Joaquin valley.

Weber Gasoline Hoisting Engine.

This hoist is 17 ft. 6 in. long and 9 ft. 6 in. wide. These are the gross measurements. The drums are so arranged that they may be operated independently of each other. The two levers for operating the lead screws and the two levers for operating the brake bands, as well as the lever for actuating the governor, are all mounted on a suitable platform, as shown, enabling the operator to maintain control of the entire hoist without moving from one position. The hoist is fitted for both tube and electric igniter. The duty on each drum of this hoist consists of lifting fifteen metric tons 400 meters per hour, making 22.3

H. P. of 75 kilogrameters on each drum. The hoist has operating cages in a double compartment shaft. The machine weighs 25,000 pounds. The feature of arranging a gasoline hoisting engine, so that the operator can reduce the speed of engine between loads, is a very important one. This machine while in our testing room before shipment, running absolutely idle at 100 R. P. M., used only the exceedingly small amount of six gallons of 74° gasoline in ten hours' continuous running. On another test it developed 48 brake H. P. continuously for ten hours on a consumption of forty-eight gallons of gasoline. On a test developing 24.3 H. P. the consumption was twenty-nine gallons of gasoline in ten hours' continuous running. From the above three

tests it will be noted that the consumption of fuel in a gasoline hoisting engine is in exact proportion to the number of foot pounds lifted in a given time, basing the calculation on one-tenth of a gallon of gasoline to each H. P. expended per hour. Using the tank system for water circulation around water jacket and valve chambers, on a continuous 40 H. P. load, the evaporation of water amounted to only twenty-two gallons during the day and over night. In its present location this is a very important feature, since water is a very scarce and expensive article.

This hoist was built for the Minas de Santa Maria de la Paz, Matehuala, Mexico, by the Weber Gas & Gasoline Engine Co., Kansas City, Missouri.

Mining Summary.

ALASKA.

From Berner's bay news is given that the Mellon M. & M. Co. have completed their 20-stamp mill which was begun last September. There are also eight 6-foot vanners on the ground, and the surface tram has been extended 4500 feet.

ARIZONA.

The United Globe mines at Globe have installed an 18 K.W. General Electric machine at their smelter for lighting and power purposes.

Near Prescott T. Roach received from 100 tons of ore milled from the Mohawk mine \$12 a ton. The vein is 5 feet wide.

The Old Dominion smelter, near Globe, is said to be turning out 30,000 pounds of copper daily at a diminished use of coke, and with not over 1 per cent copper in the slag, against 3 to 5 per cent formerly. In seventeen days the company produced over 500,000 pounds of bullion, running 96 to 97 per cent fine. Both furnaces will be operated as soon as the new hoist is completed, and then the daily product should be 60,000 to 70,000 pounds. No copper will be shipped until the railroad is completed to the mine. The roadbed is graded to the smelter, and cars should be running to the mine in a few weeks.—G. R. Sutherland has bonded the Nighthawk mine, near Mohave, and begun operations.

A shipment of forty tons of ore from the San Juan mine at Graham was made last week by C. Qualey. It netted \$1147.—G. R. Sutherland has bonded the Nighthawk mine near Mohave and begun operations.—At the Ray copper mines near Globe new operators have cleaned out and timbered the 100-foot shaft of the Poorman claim and sunk it 50 feet deeper and crosscut. In the Ray claim the shafts have also been cleaned out and retimbered.

In Yavapai county new machinery is contemplated on the Storm Cloud mine near Prescott.—J. Robinson's mine on Big Bug creek contains ore carrying \$14 in gold and sixteen ounces in silver per ton, and 48 per cent lead.—Some of the ores being shipped by Allison & Weeks from their gold mines near the Fernald are high grade.

Chicago newspaper men, headed by G. W. Weber, have bought the Placitas mines.—The Monte Cristo mine near People's valley, owned by Sinclair & Wallott, has been bonded by the Revenue M. Co., and the inauguration of work on the mine is being delayed only by effort to develop water.—Twenty-five men are at work on the Fool's Gulch mine. At a depth of 800 feet a 3 foot vein of \$30 ore was recently struck. It is proposed to sink the shaft 2000 feet.—Colorado capitalists have secured the Hamlyn group in Wickenburg district and are developing therein. The McIntosh group near by is also being developed by a Colorado company. These are both copper and gold properties carrying a little silver.—The Crown Point mine in Castle Creek district, at the 300-foot level has an extensive body of good quartz. A. O. Brodie is the owner.—R. H. Burmister is developing the B. B. mine in Cherry Creek district and also the Standard and Royal groups.—Near Prescott, A. Elliot & Co. of Goffs, Kansas, are developing the Dream mine.—The Red Rock mine in Big Bug district works twenty men. The shaft is down 300 feet. The mill crushes twenty-five tons of ore a day.—In the same district the Annie works thirty men and has a mill. At the Lottie a 2000-foot tunnel is being run. The shaft on the Red Jacket is down 60 feet and prospects are good. A steam hoist is in operation.—The Oro M. Co. at Oro Blanco employs forty-five men; the new mill will be in operation within three weeks. The shaft in the principal mine has reached 260 feet, and a tunnel has been run 400 feet.—In Washington camp, Pima county, the principal operations are conducted by the Duquesne M. & R. Co., where policy has been to develop their property before erecting expensive machinery. Two and a half years have been spent in this work and machinery for the reduction of ores is being installed.

CALIFORNIA.

Amador.

Drifting is in progress at the Amelia mine, near Jackson.—Sinking continues at the Zeila mine; also, at the Anita.

Butte.

Oroville Register: The mining outlook near Magalia continues encouraging. Forty men are employed at the Magalia and the gravel pays well. Power drills are used, driven by compressed air. A 10-stamp mill crushes the cemented gravel.—Pay gravel in the Bader mine keeps a full force employed.—In the Pete Wood mine there are fourteen men employed and the main tunnel is in 2500 feet.—In the Perry mine ten men are at work.—Work on the Banner tunnel near Oroville is suspended until the power drills are ready to operate, which will be soon.—The Alm Bros. at the Crystal Peak mine continue to develop the property.—At the Red Point mine a drift is being run.

Oroville Mercury: Placer mining at Forbestown has been at a standstill by lack of water, but with rain the yield of gold will be considerable. The miners have everything in readiness for washing gravel.—At the Gold Bank the 40-stamp mill is running steadily. Several small power drills have been installed. Work is being pushed on the 560, 700 and 900-foot levels.—At the Carlyle mine development work is being pushed and ore is worked by occasional runs in the 10-stamp mill on the property. It is locally reported that some good ore has been found.—The Slater mine is taking out good rock.—A 5-stamp mill is being built at the Gem mine near Enterprise.—Prospect work continues at the Red Point mine. The small prospect mill has been taken down and it is reported that the owners intend to build a large mill

on the property.—Several men are working at the Sunnyside mine near Robinson Mills and the stamp mill is running steadily.—At the Dewey mine near Sunnyside a 2-stamp mill is running on good rock.—M. Pullen is working the Mt. Ida, taking out ore and running the mill.—D. Burroughs is taking out ore at the Keystone near Forbestown, which he will crush at the Bullion mill.—The Berry mine near Strawberry has closed temporarily. The 3-stamp mill on this mine has been running. Five stamps are to be added.—The Richelleu or Buchanan Hill mine at Yankee Hill is pushing improvements.—The Cherokee Co. are repairing the ditch and flume from Concow to Cherokee.

Calaveras.

San Andreas Citizen: The Lively mines, near San Andreas, are closed. J. B. Luddy has taken possession of the property by order of the Fellowship M. Co. Money is due for labor and to local business men.

San Andreas Prospect: Cross & Meyers have bonded the Lost Log quartz mine in Salt Spring valley for three years for \$4000 and have begun work. The 50-foot shaft will be sunk 100 feet deeper.—Last week five claims in Angels mining district, owned by J. A. Aegerter, were sold to the Great Western G. M. Co. for \$4000. The new company is to begin immediately to develop the mines.—Work is progressing at the Chili Hill gravel mine at Central Hill. On Friday of last week the old works were tapped and the water raised 40 feet in the main shaft. The shaft is being unwatered. The developments revealed a large quantity of virgin gravel.

San Andreas Prospect: The Oriole mine, near Angels, owned by Stockton people, has been extensively developed, and new machinery is being placed.—The Utica Co., at Angels, is sinking a new shaft between the Madison and Gold Cliff properties for working the former, as the old shaft can no longer be used. The new shaft will be sunk 2000 feet. Seventy-five men are engaged in the work. The water in the old works has risen to within 75 feet of the mouth of the shaft.—Work at the Lighter mine will be conducted on a large scale. A 150 H. P. compressor will be in position Jan. 1st, and the intention is to add twenty more stamps to the mill in the spring. The mill and hoist will be run by electricity.—F. Cuneo Sr. has completed the 3-stamp mill on his mine and ore crushing will begin about Jan. 1st.—The Blazing Star mine has been placed under attachment for wages for \$800.

El Dorado.

Placerville Nugget: Work in the new tunnel at the Unity mine near Placerville is being pushed. The tunnel is in 240 feet. This is one of a group owned by the Pine Hill G. & S. M. Co. of San Francisco.

Placerville Republican: Work is progressing on the Esperanza mine near Garden Valley. The shaft is down to the 600 level and tunneling will begin soon.

Inyo.

A 6-foot ledge of low-grade galena is said to have been found in the old Montezuma mine, near Independence.

The Molus mill at Bishop closed down last week because of cold weather.

Kern.

Los Angeles Review: At the Yellow Aster mine at Randsburg 140 men are employed. When the stamp mill now being erected is completed the force will be increased. In the Panamint district a 10-stamp mill and cyanide plant will soon be in operation on the Radcliff property. This mine at a depth of 180 feet has a 4-foot vein of \$30 rock.—The Burchams in the Argus have begun developing their claims.—At Copper City the United Copper Co. of New York have put a force at work developing their claims.—At the China borax works men and teams are at work preparing for the reducing and refining plant, which will be in operation there within the next two or three months.—The Little Butte, Big Butte, Kinyon and Wedge were all shipping ore last week.—The Little Butte has taken out some high-grade ore recently. They had twenty carloads of ore hoisted from the 350-foot level in their bins last week.—The Black Hawk shipped fifty tons of \$40 ore to the Cuddeback mill.—In the O. K. mine Supt. Collins has men at work in two shafts. In No. 1 they are down 75 feet and crosscutting both ways. In No. 2, which is down 85 feet, they are drifting in ore. Last week they struck \$25 rock.—Men are at work on the Monkey Wrench and Independence. On the latter four shafts are being sunk on the ledge.—The Smith mill, ten stamps, which has lain idle at Garlock for several months, has been bought by several members of the Little Butte Co. and will be removed to Dove Springs, where it will be put up. The owners of the mill expect to keep five stamps busy with their own ore, and the other battery will be given to custom work.

Randsburg Miner: The shaft in the Little Butte is down 535 feet. At 500 feet they are running a drift and taking out good ore. Their own mill is running night and day on their richest ore, while a carload is sent to Barstow each week. The new mill on the Hard Cash has started.—Wilson and Kohen have leased, and are taking out twenty tons per day and milling it at Kane Springs.

Mariposa.

(Special Correspondence).—After a shutdown of six weeks, due to lack of water, the Merced Co. resumed operations on the 20th, sufficient water having been secured from Maxwell creek by means of pumps and ditches.—Work is in progress for equipping the Mt. Gaines electrically, the power being taken from Merced falls, where a new station will be built just below the one transmitting nineteen miles to Merced for lighting purposes.—A few men have gone to work on the Virginia and it is reported the whole property will be in operation after Jan. 1st.—Lumber is being delivered for the Big Betsy mill and sales of that company's stock are being diligently pushed. Very interesting developments are looked for from this property as soon as the mill is in running order.—Capt. Ward is taking some excellent ore from the Spencer just now.—The case of Reynolds vs. Bruner, involving the mineral character of a school section near Coulterville, is on trial here this week.

Mariposa, Dec. 20th, '98.

Mono.

The new mill at the Standard Con. mine at Bodie is nearly completed. An addition of one wire to the pole line has been finished for four miles. At tailings plant No. 1 there were treated during the week 361 tons of tailings. The November product of the tailings was \$5400.

Nevada.

Grass Valley Union: It is stated on good authority that the Malakoff Co. at North Bloomfield have struck good gravel in their bedrock tunnel and the indications are that the streak will prove continuous.

Nevada City Transcript: The new mill at the Texas mine, ten stamps weighing 1000 pounds each, near Nevada City, will be running within a month.—The Nevada County Electric Power Co. has doubled the capacity of its plant, which in its entirety will be in operation Jan. 1st.

Grass Valley Union: The Kirkham mine, near Nevada City, will be unwatered and a drift from the bottom of the shaft will be run.

Nevada City Transcript: Near Nevada City C. Marsh took \$50 in gold from three pans of decomposed quartz.—The litigation over the ownership of the Midnight quartz mine, at Nevada City, which has been in the courts for five years past, has ended. E. Tilley is now the owner. He will lose no time in reopening the mine on an extensive plan. He has men at work and will in the spring erect hoisting works to continue on the ledge below the tunnel.

Grass Valley Union: After many years of idleness, work on the old Jenny Lind gravel claim, near Nevada City, will be resumed. C. Stocks has secured the property. The tunnel on the claim is in 800 feet, and by running 200 feet farther they hope to tap the channel worked years ago and abandoned because of a large cave occurring.—A company of local miners, headed by J. L. Gluyas, will open up the old Sazerac gravel claim, in the Rough-and-Ready district. This property has been in litigation since 1871. There is a tunnel 400 feet long on the property.

Plumas.

The Plumas Independent is informed that the Cayot Con. quartz mine near Quincy, owned by F. & G. Cayot, has been bought by a San Francisco company. The owners contemplate building soon.—J. August brought to Quincy last week \$300 in coarse gold.—Mrs. Gruss will add fifteen stamps to the quartz mill on her mine in Genesee.

San Diego.

(Special Correspondence).—Pittsburg, Pa. people have secured the Owens mine and mill at Julian to develop it, and to determine the question of a sale.

The Helvetia near Julian having been unwatered and partially retimbered, ore is being extracted, which when milled, if of sufficient grade, will lead to close of sale to Denver people.

Work on the buildings, etc., for the cyanide plant at Cuyamaca, for the treatment of Stonewall tailings is progressing and sixteen men are employed. It will be about six weeks before the tailings go into the vats, of which there are to be eight, of a depth of 5 feet, and diameter of 30 feet. It is thought it will consume one year to work over the large dump.

A recent strike in the Ranchita is turning out some "specimen" ore which mills well. This mine has recently gone into the hands of a receiver, a Mr. Lane having been put in charge to represent the Julian Mercantile Co., which had Supt. Coutts ousted and Mr. Lane substituted.

There have been several transfers of mining property in the Deer Park country lately, notably that of the Nobles Bros., the price reaching into the thousands.

Galena has recently been discovered in El Cajon butte, its extent not being as yet determined; it looks like good ore.

San Diego, Dec. 18th, '98.

Shasta.

Redding Free Press: A carload of 50,000 pounds of ore from the Ruby Hill mine, near Copper City, was shipped to the Selby smelter.—The Midas G. M. Co. at Harrison Gulch, in the spring will sink a shaft on the ledge from the lower tunnel to the depth of 1800 feet. Ten stamps are being added to the mill.

J. Cannon is leasing the Scorpion mine at French Gulch and is taking out high-grade ore.—G. R. Simmons has an 18-inch vein and is taking out shipping rock.—Blagrove & Collins, leasing on the Washington mine, have a 1-foot vein of \$70 rock. All the Washington leasers are doing well.—The 5 stamp mill being erected at the Washington will be in operation in ten days. Six hundred tons of leasers' rock is awaiting treatment.—P. Schnitzer is taking out gold from his placer claim.—The Oro Psyche mine, the property of G. T. Reinhaus, is showing well.—The Niagara mine is not being worked at present.

W. Driscoll has a 30-inch vein of \$20 rock on his Washington Hill property. He is in 250 feet.

Shasta Courier: Hubbard, Bull & Kingsbury are taking out good ore at the old Crystal mine near Igo and have been doing so all summer.—J. P. Wright & Sons are shipping high-grade silver ore.—J. K. Lewis will start his arrastra as soon as water comes.—E. L. Ballou is at work on his Falls and Manzanita claims, and expects to start his mill when water is available.

Sierra.

F. L. Coe has been appointed assignee of the estate of the Goodyear M. Co. at Downie-

ville.—Ponta Bros. are developing a 4-foot ledge, which they recently discovered.

Siskiyou.

A company has men at the Black Jack mine fitting up machinery preparatory to opening up the mine.—J. & G. Maine have secured the Horn mine at American Bar and will begin work early in the spring.—Bar & Samon have sold a half-interest in their Dewey quartz mine to two Colorado men, who are to erect a stamp mill and sink another shaft. The ore is said to run \$17 a ton free milling, and the vein averages 5 feet in width.—G. A. Warder, who owns near Callahans, is doing considerable development work this winter. The vein is about 30 feet wide and crops for a distance of 1200 feet. The ore is low grade, averaging \$8. He also owns the Bismark mine, which has a vein from 15 to 50 inches wide, with a tunnel on the vein 30 feet. The ore goes \$30 to \$35 free gold and 20 per cent sulphurets. Mr. Warder contemplates building a mill.

Yreka News: J. Keeder of Fools Paradise has struck a 4-foot ledge on his Bonanza mine that goes \$30 per ton gold.—The Miner & LaFlesh mill has shut down on account of the water freezing.—The China claims, near Honolulu, are paying well. They will continue work until the high water drives them out.

J. W. Downing has bought the Cole interest in the Klondike mine on Ash creek, and will put men to work soon.—The Roberts & Gillson mill is running day and night, but if the cold weather continues they will be obliged to shut down.

Trinity.

The Chamberlain hydraulic mine, near Lewiston, has been sold to the Adele M. Co., a corporation organized by San Francisco and Pennsylvania capitalists. Everything is in readiness for the operation night and day, as soon as the water supply will permit.

Tuolumne.

Jamestown Magnet: The Leap Year gravel mine at Jamestown has been bonded to Hawley & Cardwell for \$15,000. They begin work immediately.—A new 20 or 40-stamp mill for the Golden Rule mine at Stent is contemplated.—L. Radovich is doing development work on the Possible mine near Columbia.—Work on the Over mine near Saw Mill Flat has been resumed.—J. Parker has bonded the Lovell ranch near Columbia and has put a force at sinking a shaft.—G. Smith of Columbia has bonded his quartz claim to San Francisco people, who are preparing to begin operations.—Conlin Bros. have struck the vein on the old Experimental mine.

Sonora Democrat: Work will resume on the Mt. Zion in the Big Oak Flat country, recently bought by Cassaretto & Cramer.—It is locally reported that good rock was uncovered last week in the Hope.—The Black Oak mine near Soulsbyville is doubling its milling capacity, the second time this year, first adding ten and now twenty stamps.—It is estimated that 200 prospectors are working in the Moccasin Creek district.—Boring by the Columbia Gravel & Expl. Co. near Columbia is resulting satisfactorily. A depth of 200 feet has been reached. Wash gravel was struck at 155 feet and still holds out.

Sonora Independent: J. R. Parker of San Francisco has begun work on the Fox gravel lead near Columbia.—J. Stutz sold his interest in the Graham & Conlin mine to Ball & Stone of Sonora, who have also leased the Hudson & Calhoun mine in that vicinity, and will begin work at once on both properties.

COLORADO.

BOULDER COUNTY.

At Ward the B. & M. mine is producing about 300 tons of ore per month and has fifty men on the payroll.

At Eldora twenty veins are said to have been opened in the Mogul tunnel in driving 800 feet, of which ten are in pay.

CLEAR CREEK COUNTY.

The Georgetown Courier is informed that the Doric has placed \$50,000 in new paper on the London market, for the purpose of renewing work on the tunnel.

DOLORES COUNTY.

There are fifteen men on the Rico-Aspen properties, extracting ore on the percentage plan.

EAGLE COUNTY.

Ore shipments from Red Cliff last week were eleven carloads, a total tonnage for the year of 11,881.

EL PASO COUNTY.

Late shipments of two carloads of ore from the Guess mine at Cripple Creek returned from \$50 to \$75 per ton.—Three shipments recently from the Climax, operated by lessees, returned two and one-quarter ounces to the ton.

The three shipping leases on the Hull City Placer—the Fox, Russell & Allen and Vaughn & Christian—are crowding their output. The Kilton sampler is treating seventy to ninety tons a day for these lessees alone.—The Isabella Co., at Cripple Creek, contemplate the erection of a heavier plant of machinery over the Lee workings about Jan. 1st. They will also put in a new air compressor for twelve or fourteen drills. The shaft is down nearly 740 feet, but will be continued to 1000 feet.—A shipment of twenty-two tons was made last week from the Jack Pot. The ore is valued at \$15,000 and is taken from the Creston lease.

On the Republic it is said the output for the month will be 750 tons. Three carloads of ore, averaging \$40 per ton, have been shipped this week.—Three carloads of ore—two of screenings and one of coarse rock—were marketed last week from the Johnstone lease, whose output for the month, it is estimated, will reach 750 tons.—A standard gauge car of ore, containing twenty tons, was shipped last week from Anaconda, whose gross value is variously estimated at between \$15,000 and \$20,000. This shipment was made by the Creston (La.) Leasing Co. from the Jack Pot.—A lease for \$20,000, running eighteen months, has been given by Hale & Co. to East-

ern people on the Clyde mine, near Victor. Machinery and pumps will be installed and the property thoroughly developed.

GILPIN COUNTY.

The Topeka mine near Central City is producing both smelting and milling ore. Last week a shipment of eight tons yielded forty-one ounces of gold per ton. Another shipment of four tons ran over \$1000 per ton. In November the property produced ninety-two cords of ore, the average of which after treatment at the mills gave returns of five ounces of gold per cord. The production of this mine is between \$15,000 and \$20,000 per month.

Near Central City the Cook mine is taking out enough ore to keep 120 stamps dropping, and has 123 names on the payroll.—Last week was deposited a gold retort of 215 ounces by the Pierce mine, the result of a run on seventy-eight cords of ore. Besides the gold cleaned up on the plates there is a large tonnage of tailings. This mine is shipping thirty tons of mill ore a day. The smelting ore carries values of from three to seven ounces gold per ton.—In November the Kansas-Burroughs Con. M. Co. shipped 2700 tons of ore.—Last week H. P. Lowe, of the Topeka mine, Russell district, received \$4344.50 for four tons of ore and \$8500 for an eight-ton shipment.

GUNNISON COUNTY.

Gunnison News: About 200 men are at work in the coal mines at Baldwin and considerable bituminous coal is being shipped.—The Maid of Athens mine at Pitkin is producing and shipping a considerable quantity of high-grade ore. The output is twenty tons a day.—The Chloride is loading about a car of ore per week at Ohio City. The values are principally gold and the ore averages \$80 a ton net.—The Bimetallie M. & L. Co. is operating near Ohio City. The ore nets \$104 a ton.—The Black Queen mine at Redstone shipped the first car of ore over the Crystal River Railroad.

LAKE COUNTY.

The Resurrection G. M. Co. at Leadville is shipping ten cars of ore daily.—The total production of gold ore from the Ibez mines at Leadville for November was above 8000 tons.—Douglass & Newton, lessees of the A. Y. and Minnie mines, output in November 1100 tons of high-grade lead sulphide concentrates. The White Cap mine on Iron hill produces fifty tons per month, which carries one ounce gold and seven ounces silver.—The Ruby mine is shipping fifty-five tons daily of lead ore.—Thirty cars of ore are shipped daily from the Ibez group of gold mines.—Forty tons of good grade of silver-iron ore are shipped daily from the Great Hopes mine. Some lead is being marketed, which nets \$90 per ton.

The Mahala M. Co. is shipping 125 tons of iron and lead sulphides daily. The payroll carries ninety-five names.

MINERAL COUNTY.

The Solomon mine at Creede is operated under lease by Abbott & Rowley. They employ twenty-five men; the ore is lead and zinc. On the property is a 75-ton concentrating mill. The zinc is shipped to Joplin, Mo.—During the year the Champion has output 200 tons.—The Mollie S., operated under lease, has shipped seventy-five tons of ore since summer.—The Kreutzer Sonata has shipped sixty tons since September.

OURAY COUNTY.

Ouray Herald: The Grizzly Bear mine continues its shipments, and a train of forty burros makes trips twice a day during the week.—The Atlas in the Sneffles district, recently bought by Carroll & Co., is producing high-grade gold and silver ore.

SAN MIGUEL COUNTY.

The shipments of copper ore from Placerville averages two cars a week. The ore shipped is rich, the lower grade being kept for home treatment until the smelter at Paradox is completed.—The Gold King mill is running twenty-five stamps. The yield of the ore is satisfactory.—The Smuggler-Union mill is consuming close to 200 tons of ore every twenty-four hours, turning out several cars of high-grade concentrates a week.

IDAHO.

Florence Miner: The Fortune mine, Buffalo Hump, was sold to the Buffalo Hump D. Co. for \$6000 cash.—At the Iron Crown mine, near Florence, the mill is running regularly and making good clean-ups. At the last mill run of thirty hours \$1750 was taken from the plates.—The dredges at Idaho City and Placerville have closed operations for the season; they ran long enough to demonstrate that they are paying properties. Work is still going on at two at Centerville, and it is learned that two more will be built there as early as the weather will permit next spring.—A company has procured an option on the Jumbo mining claim at Buffalo Hump for \$75,000. S. I. Silverman is at the head of the undertaking. He says that the ledge on the Jumbo is from 12 to 20 feet in width at the outcrop and that development thus far has shown a good milling property. In a tunnel that has been driven ore is exposed that shows an average of \$40 per ton in gold.

Silver City Avalanche: The sale of the Empire mine, near Silver City, to Senator Pettigrew of South Dakota and his associates, has been made. About fifteen men are employed this winter, and some good ore is being extracted.—Lewis & Davis, who have a lease on the Burro claim, are pushing development work.—At the Cumberland mine work will soon be resumed.—In the Addie mine they have 14 inches of fair grade ore. Work will continue all winter.—The Poorman mine is still running on the 150-ton test lot of ore.—The Big I mine at De Lamar is shipping high-grade ore.

Idaho City World: Extensive developments have begun on the Blue Jacket mine in the Seven Devils country. A crosscut tunnel is in 250 feet. The ledge will be cut at a depth of

350 feet. The ledge will be drifted on until a depth of 800 feet has been reached.—On the Peacock, the company's main property, the developments show an ore chute 300 feet long and 40 to 60 feet wide. A company has been organized to put in a 500-ton smelter next spring, in which Glass Bros. of Basin, Montana, are the prime movers.

In a clean-up recently at the Lucky Boy mine 100 tons yielded \$15 a ton. The vein is from 5 to 6 feet wide. Three men in the mine have been keeping the mill supplied with ore, and took out seventy-five tons in addition to the 100 tons crushed.—J. K. Fleming, Supt. of the Lucky Boy mine, has secured a bond on the Illinois, adjoining the Lucky Boy. This mine, worked to a depth of only 50 or 60 feet, has yielded between \$200,000 and \$300,000. The mine cannot be developed any deeper by tunnel. It is estimated that an outlay of \$10,000 will be necessary to develop the mine.

MONTANA.

The last dredge boat to shut down on Grasshopper creek was the A. F. Graeter, which completed its run for '98 last week. This has been a profitable season for the big gold saving machines.

At the New Year mine at Lewistown the new mill will soon be in operation. The capacity will be forty tons per day. The company has developed a coal mine, which furnishes fuel, in proximity to the mill. The force employed is thirty-five men.—McDowell & Blewett of Butte recently secured a \$20,000 lease on the St. John mine at Copperopolis in Meagher county. They have men developing the property and are pleased with the showing made. Assays show 40 per cent copper. The first carload of the ore was received in Butte last week.—The Emery mine at Butte is making weekly ore shipments.—L. O. Enoch made a clean-up of \$1200 from a three weeks' run on Eureka ore.

Phillipsburg Mail: The mining property owned by Smith & Kent near Phillipsburg has recently been bought by C. D. McLure and P. A. Fusz for \$20,000, with a cash payment down. Development has begun. A shaft has been sunk 110 feet and the showing in the levels on the lead is good. The ore at that depth is high grade, samples assaying 7000 ounces in silver, and a shipment of thirteen tons recently netted over \$3000. A hoisting plant will be erected and large pumps installed.

Clancy Miner: The Pilot mine near Clancy will resume operations. The property is equipped with a concentrator, and a steam hoist capable of developing the mine to considerable depth.—T. W. Ross is developing a property near Clancy in which he has a ledge said to be from 8 to 10 feet in width, and from which a sample shipment to the smelter gave \$150 a ton.

NEVADA.

Pipe for the Evans pumping plant, to unwater the Comstock 500 feet, is beginning to arrive at Virginia City, and the Risdon Iron Works, which has the contract for the work, is getting ready the pump for shipment. It is expected that the actual work will begin next month.

The Occidental mill at Virginia began dropping fifteen of its stamps on ore from the mine last week. The other five will soon be started. The twenty stamps have a crushing capacity of sixty tons daily. The ore is above the average grade.—The mills in Six-mile canyon, closed on account of the recent frost, are again in operation.—The Indian Queen mine in Esmeralda county is said to be producing good ore.

Ely News: C. S. Davis, Mgr. of the Ely M. & M. Co., says it is the intention to thoroughly develop the mine before erecting a mill. The showing in the shaft is good at 100 feet.—The Prince mining claim at Pioche was sold by the sheriff last week for \$900 to satisfy a judgment.—Mining machinery is being delivered at Bullionville, Lincoln county.—Near White Pine a body of ore has been opened in the Union Jack by the Butterfield M. Co. in a 300-foot tunnel, and the crosscuts of the vein show its width to be 20 feet, carrying gold values.

Eureka Sentinel: A large amount of ore is being shipped from the Eureka Con. mine.—Smith & Jackson, working the Homestake and Rocco mines near Hamilton, will continue to work six men during the winter prospecting the mines. The last shipment for the season was made last week.—At the McEllin mine, a lead producer, a few men are sinking the shaft on contract.—In October extensive preparations were being made for the erection of a water-jacket smelting plant at the Wheelan-Dougherty mines at Copper Basin. The mines were said to have been sold to a California company, and active development work was expected to be in progress before now. A misunderstanding is said to have recently occurred, and M. J. Donovan, Supt. for the California people, is having all the improvements and machinery removed on the E. & P. railroad in Pine valley.

NEW MEXICO.

At Santa Fe on the 21st the United States Court of Private Land Claims restored to the public domain the Estancia land grant, made in 1845, and claimed by Joel Parker Whitney. It contains 500,000 acres.

In Cooney district the Helen M. Co. is building a pipe line which will furnish the Confidence mine with power for hoisting, milling and lighting the mine and 30-stamp mill, generating 500 H. P. The Confidence group is producing seventy tons of \$30 ore per day. The development work consists of a 1000-foot tunnel, about the same amount of drifts, winzes and 1800 feet of shafts.—A tunnel is being run on the Cooney property 900 feet to tap the ore chute at a depth of 650 feet. This has been a producing property since 1880.

The Maude S will be reopened shortly. It was closed in 1897 because the character of the ore changed and the mill was losing the values.—In the Baldy district a tunnel is being run on the Aztec property 100 feet lower

than the old workings. The Aztec 20-stamp mill has been repaired and is being supplied with low-grade ore from the smaller veins on the property.—The Wallace placer field, embracing 10,000 feet of ground on the South Ponil river, Colfax county, was sold last week to Col. Mathews of Hutchinson, Kansas. The dirt will yield from 20 to 70 cents per yard.

At Central the Texas shaft has reached a depth of 500 feet.—At Hanover the Philadelphia is a regular shipper to the Silver City Reduction Works. The ore is copper pyrites.

Near Elizabethtown the Montezuma G. M. & P. Co. employs twenty-four men. The vein has a width of 60 feet.—Work has resumed by the Hematite Tunnel Co.—At Santa Rita the Santa Rita Copper & Iron Co. is making regular shipments of iron ore.

OREGON.

Shipments from Sumpter for November were 429,790 pounds of concentrates and 73,550 pounds of ore, a total in five months of 2,453,464 pounds.—At Granite on the Cougar mine M. Larkin contemplates building a mill of 100 tons capacity.

The Grant's Pass Journal is informed that Senator Jones & Co.'s mill on Mt. Reuben will start up this month.—The Star Gulch Hydraulic M. Co. has everything in readiness to start when rain sets in.

Ashtand Record: It is locally reported that the Black Jack gravel mine, near Hornbrook, will be put in operation again.—Knapp & Pollard of San Francisco will run the Dugan & Knapp placer mine, near Ashtand.—The Swayne mine, on Big Applegate, is working twenty men.—F. G. McWilliams had nine tons of ore crushed from his quartz mine near Jacksonville the other day. It did not come up to 50 per cent of the assay. He will make another test.

UTAH.

The Midnight Bowers mine, Tintic, has let a contract for putting the shaft down 200 feet.—The Northern Light of Lion Hill last week, after an interval of over a year, shipped ore that yielded 247 ounces silver, \$4.80 in gold and 6.9 per cent lead per ton.—De Lamar's Mercur Mines Co. made a consignment of auro-cyanides last week from the Golden Gate mill, valued at \$75,000.—The Old Susan mine, in Tintic district, which was a producer twenty-five years ago, but has been in litigation, has resumed work.—Work was resumed last week on the Dagmar-Eureka group, near Eureka.—From Eureka the Sunbeam shipped three cars of ore and the Joe Bowers one.—The Dalton M. Co. at Marysville bought a group adjoining its mine for \$5000.—The Iron Duke mine at Silver City was sold last week to the Monterey M. Co. Upon the Duke is a shaft 370 feet deep. Ore has been found that showed 170 ounces silver, 2.75 ounces gold, 30 per cent copper and 35 per cent lead.—Tests made upon the ores of the Mammoth mine at Bingham gave an average value of \$9 gold per ton. Of this class of ore there are 2000 tons on the dump. In the 200-foot level are 2 feet of ore said to yield \$24 per ton.—From Tintic were shipped last week 84 cars of ore, 13 of concentrates, and 34 bars of bullion.—The Ajax mine at Mammoth shipped ten cars of ore this week. Included in this shipment are the first five cars from the new gold chute that has been opened between the 200 and 400-foot levels, and of which there are over 5 feet. According to assays, this ore shows \$20 in gold, 5 per cent copper and six ounces silver.

Near Vernal the new Bromide smelter is running full capacity.—G. Holmes and associates of Salt Lake City have secured a group of copper-bearing claims near Paradise for \$40,000, payable in six months.—In Clifton mining district the Midas mine, under the supervision of Mr. Grant, is piling up ore to be put through the mill to be built soon on Midas ground.—From the Spotted Fawn mine Murdock & Co. are marketing a fine quality of silver-lead ore.

Park Record: Eighteen bars of silver bullion from the Marsac refinery were shipped last week from Park City. This bullion was the product of Ontario tailings.—The shipments of ore for the past week were 1,490,140 pounds.

The Bingham Bulletin approximates the ore shipments for September, October and November from Bingham at 12,377 tons.—A shipment of high-grade copper ore was made last week from one of the Old Telegraph leases at Bingham.—A 1000-ton lot of Dalton & Lark dump ore was bought by one of the smelters.—The ore from the new strike in the Frisco assays 49.6 per cent lead, twenty-nine ounces silver and \$1.10 gold.—Butte people are figuring with the St. Joe Co. to advance the deep tunnel of the St. Joe group 3600 feet.

Mercur Mercury: The owners of the Old Fred at Mercur hope by spring to be ready for a mill. A contract has been let to sink a winze from the 400-foot tunnel to the third vein, which has been extensively prospected in another part of the ground.—W. A. Clark, of Butte, Mon., has bought the control of the Ophir Hill mine, and it is locally reported that he will begin soon to enlarge the mill and put the mine in a condition to furnish larger tonnage. There is said to be much ore that can be treated by the cyanide process and a cyanide plant may be added. The property is capitalized for \$25,000 in shares of \$25 each.—At the Daisy the mill is supplied with ore. A shaft has been sunk on the vein which was found while clearing the ground for enlarging the mill, and \$7 a ton ore was found.

Mercur Mercury: The Geyser-Marion mill and mill 200 tons of ore per day, commencing Jan. 1.—A large vein of low-grade silver ore has been opened up in the Hercules, running from ten to twenty ounces silver and \$2 to \$6 in gold. It is too low grade for shipping and it is probable that the company will build a cyanide mill.—The pipe line to the Chloride Point is completed and the mill is 100 tons of ore per day and shipments will be larger than formerly. It is probable that

leaching tanks will be added to the plant.—The Northern Light's first shipment of ore since July, 1897, was made last week and a second carload of 600 sacks went out last Saturday. Assays of the first shipment showed values of \$4.80 in gold, 247.1 ounces silver and 6.9 per cent lead to the ton.

WASHINGTON.

(Special Correspondence).—The Monte Cristo district, fifty miles east of Everett, is developing gradually, the greatest drawback at present being that about five miles of the railroad which reaches the district is washed out, with no likelihood of its being repaired this year. The Monte Cristo ores are an arsenical iron, rich in copper.

The Gold Basin district is reached by wagon road from Wallace, on the Great Northern. It is claimed a fair tonnage of ore has been mined, which is ready for shipment. The Forty-five and the Sultan are the best developed of Gold Basin properties.

It is reported that the Penn Mining Co., operating in that section, recently cut a vein of ore 10 feet in width that pays well.

From Index, forty miles east of Everett, an electric line to Galena, twelve miles distant, is being planned. Most of the ores at Galena are high in copper. In this district the Sunset Mining Co. is developing a property with energy. It is asserted that they have uncovered a copper ledge 25 feet wide for 1700 feet, and that the ore runs 34½ copper. The ores exhibited at Everett are fine specimens of rich copper-iron. The building of a small smelter on the ground is contemplated. This company was organized and is managed by John E. McManus of Everett.

While the region of the Cascades in Washington is difficult to prospect, owing to the heavy undergrowth, it is being investigated a little more thoroughly each year, and development on both sides of the range has resulted favorably.

The Everett smelting plant has added a refinery capable of treating 1000 tons a month of base bullion. The smelter operates four roasters and two furnaces. The management reports getting a small tonnage of ore from the Cascades, which is increasing. Some of this comes from the Mathow district.

WASCOOT.

Everett, Wash., Dec. 10th, '98.
A depth of 300 feet has been reached on the Black Tail mine at Republic, and the ore is said to run \$25 per ton in gold.—At Bossburg 12 feet of ore, yielding \$11 per ton in gold, has been disclosed on the Ben Franklin.—The Great Northern mine has reached 150 feet and has shipping ore going \$20 per ton.—The Black Butte mine near Cottage Grove is said to be turning out quicksilver at the rate of \$30,000 per month. The output will average a ton a day for the year round. The smelter was erected during the summer and began operations October 10th.

Spokane Review: At Chelan, on the Colville reservation, M. D. Griffin & Son have bonded three claims to M. L. Turner of Seattle, representing New York capitalists, for \$500,000. The first payment is \$50,000, and the purchasers begin at once and push development. In six months a payment of \$50,000 will be due, and the balance, \$245,000, at the expiration of a year.

WYOMING.

Grand Encampment Herald: The Rambler mine at Battle Lake in the 170-foot shaft ran a 100-foot drift which cut three new veins. The last vein reached is 5 feet wide and is copper-bearing ore.—T. G. Clemmons & Co. have leased the Melita mine near Grand Encampment and are taking out shipping ore. It carries gold, copper and silver.—F. M. Benson has sold an interest in the Little Marion, Commodore and Magnolia claims to Michigan people and the new owners have contracted for sinking to begin at once on the Little Marion.

FOREIGN.

BRITISH COLUMBIA.

The ore shipments from the mines about Rossland from Jan. 1 to Dec. 10, '98, were 121,431 tons. Shipments from Dec. 3 to Dec. 10, inclusive, were 2460 tons.

Rossland Miner: The announcement comes officially from Montreal that the C. P. Railway will at once begin the construction of a big smelter somewhere in the Boundary country. Its capacity will be from 500 to 1000 tons daily, and it will be devoted exclusively to treating the low-grade copper ores of the Boundary country.

MEXICO.

Two Republics: From the Mazapil, Durango, gold mines, lately acquired by a Belgian corporation, last week twenty-five tons of ore were shipped to Belgium for a test treatment. The company, which owns large copper properties, is said to contemplate the erection of reduction works.

Operations have begun on extensive development of the Seven Star mining property, near Chuichupa, Chihuahua. The mine has seven well-defined veins and the ore assays high in silver. The company will erect a smelter soon.—The Roy mine of Pilares district is shipping ore via Casas Grandes and the Sierra Madre railway to El Paso. The distance from Pilares to railroad at Casas Grandes is 111 miles. The ore is carried to Casas Grandes ninety-six miles by wagon and fifteen miles by pack animals.—There are three mines at Pilares employing from 150 to 200 men, and each is shipping high-grade ore. These are the Roy, the Cinco de Mayo and a group worked by J. Santa Cruz.

ONTARIO.

At Sturgeon Falls the Hidden Treasure mine has been leased for \$55,000, and on the Golden Crown mine \$8000 is to be spent in development this winter under an option.—The Independence has let a contract for sinking another 100 feet, which will make the shaft 175 feet deep. The 5-stamp mill in its last run of twenty-six days yielded \$2000 in gold.

BAKER & HAMILTON,

MACHINERY DEPARTMENT.

OUR "CLASS D" ENGINE,

Shown above, is a heavy, well-proportioned, self-contained Engine, with all reciprocating parts perfectly balanced. The cylinder is jacketed, and the main bearings are provided with means for adjustment. The connecting rod, straps and keys are forged from refined iron, and the crank is cut from a solid forging. The slides and crosshead are of extra length and width, giving ample wearing surface. 10x12, and larger sizes, are furnished with balanced valve.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done FIFTY PER CENT Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

VULCAN ROPEWAY

— WITH —
AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by
your company to convey tailings from Morgan Mill to Mexican
Mill, a distance of seven-eighths of a mile, is giving entire satis-
faction. We transport 200 tons of tailings in ten hours; one man
does the whole business, including elevating tailings from hop-
per in the ground, operating Vulcan self-loader, and attending to the
Ropeway generally. The self-dumper requires no attention whatever.
The Vulcan loader I consider the best feature in the whole
Ropeway, making it possible for one man to load 200 tons in ten hours.
Yours very truly,
J. P. WOODBURY, Supt.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1873. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Assessment Notices.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 15th day of November, 1898, an assessment (No. 15) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 15th day of December, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 21) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor, Mills building, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23rd day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CHARLES E. ANDERSON, Secretary.
Office—Mills building, room 31, 10th floor, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 22) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 30th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 5) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
GEO. W. FLEISSNER, Secretary.
Office—773 Mission street, San Francisco, California.

DELINQUENT SALE NOTICE.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 15th day of November, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. | Cert. | Shares. | Am't. |
|---------------|-----|-------|---------|---------|
| William Day | 602 | 100 | 100 | \$10 00 |

The Tropenas Steel Process.

In '99 the Union Iron Works of San Francisco will begin the manufacture of steel on the Pacific coast in connection with their extensive works at the Potrero. It would be further gratifying to be able to say that

the iron would be a Pacific coast product. In several parts of California, Oregon and Washington are large deposits of suitable iron ore. Not a month passes without the receipt of a letter from some one somewhere in those three States citing the existence of the very kind of ore fitted for the manufacture of steel. To recount the reasons for such non-development would be unnecessary to those who can understand

them, and useless to those who can not. Probably the most potent are the elements of fuel and transportation. Steel can to-day be bought in the United States for less than \$15 per ton. This is on the authority of Andrew Carnegie. Alabama is to-day making pig iron at a cost on the cars of less than \$6 per ton; this is on the authority of that State's geologist. When the simple fact is cited that among the other elements of cost in previous coast experience, figures one of \$8 per ton for fuel, it will be seen why the great iron deposits of this coast are not profitably worked. However, since the closing down of the Pacific Rolling Mills, the Union Iron Works (which was that concern's largest customer) must have steel from some source, and is now putting in a 10-ton converter and building the necessary appliances.

While the above is cited as showing why coast iron ores are not more largely developed it must not be understood that the prices quoted are for other than the cheapest qualities, as there is steel and steel. "Steel" in the form of rails can be bought at the mill for \$18 per ton, and "steel castings" can be had

there for \$70 and \$80 per ton, but such quality would not be effective for other requirements.

During his recent visit to Europe, Irving M. Scott

FIG. 2.

secured the right to use the Tropenas steel process, which was commended to his attention. This, it is believed, will mark a new era in steel making in the United States. So far as known, there is but one other "Tropenas process" plant in the United States, and that (in Connecticut) is not in operation.

It has been generally successful in Europe, and, with the resources of the Union Iron Works, it is safe to assume success. The characteristics of the Tropenas process are described as follows: 1. Low-pressure blast, always above the surface of the metal and through the lower, or "fining" tuyeres. 2. The disposition of the tuyeres in the horizontal plane, so that the jets of air arriving above the bath cannot impart to the latter any gyratory motion. 3. Great depth of the metallic bath, so as to avoid churning and stirring during the operation. 4. Arrangement above the "fining" tuyeres, and independent of the latter, of a supplementary row of "combustion" tuyeres, so as to burn the combustible gases escaping from the metallic bath and thus increase the final heat of the steel. As to the waste of the operation, it has been found that from the cupola the waste may be as much as 6½ per cent and from the converter itself as much as 12½ per cent, a total of about 17 per cent. The pig iron used is of the Bessemer quality, inasmuch as no phosphorus is removed during the "blow." The process has not yet been applied to Thomas iron (basic Bessemer).

Herewith appear three illustrations of this process and the metal made by the use of it. Fig. 1 shows a vertical view of the converter with the two systems of tuyeres. Fig. 2 shows a part of a gun casting for the Woolwich Arsenal, and Fig. 3 a steel casting, made by Edgar Allen & Co.,

Sheffield, England, bent and tied cold. From the *American Manufacturer* it is learned that about 30,000 tons of steel castings are now made by this process per annum, and the use of it is extending. Physical and chemical tests of the metal have shown it to be well adapted for all the ordinary purposes for which such material is used. Experience with it abroad has demonstrated its value as an adjunct to the foundry, if indeed it be not superior for many important classes of casting work.

Power Distribution by Vertical Rope Drive.

The illustration shows the distribution of 75 H. P. to the several floors of the manufacturing establishment of the Mergenthaler Linotype Co., Brooklyn, N. Y., the power being carried across the court to a jack shaft and then up and down to the various floors. One continuous rope is used, and a sufficient number of wraps made at each floor to transmit the power required there. The drive to the various floors are all vertical, and as the slack in the rope is automatically taken up, all the difficulty that there would be of keeping belts tight for this kind of drive will be readily appreciated by those who have had experience with them. This drive was installed by the Link-Belt Machinery Co. of Chicago, who are

75 H. P. VERTICAL ROPE DRIVE, MERGENTHALER LINOTYPE CO., BROOKLYN, N. Y.; POWER DISTRIBUTED ON SIX FLOORS.

FIG. 3.

the pioneers in the manufacture of this class of machinery, and who have designed and installed many of the largest rope drives in the United States.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Seventy-five H. P. Vertical Rope Drive, Mer genhaler Linotype Co., Brooklyn, N. Y.; Power Distributed on Six Floors, 653. The Rix Variable Volume Air Compressor, North Star Mine, Nevada Co., Cal., 658. Sectional View Air Compressor, North Star Mine, Nevada Co., Cal.; Vertical Elevation Cylinder Air Compressor, Jumper Mine, Tuolumne Co., Cal., 659. Probably the Oldest Structure in the United States, 660.

EDITORIAL.—The Tropenas Steel Process; Power Distribution by Vertical Rope Drive, 653. Something New in Iron Castings; A Great Year for the Gas Engine; An Example of Successful Deep Quartz Gold Mining; California's Contribution for the Paris Exposition; Decreased Gold Output of California for '98; Laxity in Mine Management; No Such Thing as "Luck"; A Great Year in the Mining Industry; Transmission of Long-Distance High Voltage; Progressed With Marvelous Rapidity, 651.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 662-63-64. THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 677.

MISCELLANEOUS.—Concentrates, 655. Mistakes in Mining; Compressed Air; Excavator for Constructing an Irrigation Canal; "Concentration After Lixivation," 656. The Duplication of Drawings, 657. Automatic Air Compressors Adapted for Electric Motors, 658. Concentration After Lixivation, 659. An Injunction Granted; Supposed to be 300 Years O. D., 660. Recent Mining and Metallurgical Patents; Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 661. Recently Declared Mining Dividends; Trade Publications; Commercial Paragraphs, 664.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory*.

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory*.

SOMETHING new in iron castings is reported from Scottdale, Md., where a concern this month turned out a "breeches pipe," used where the main of a pipe line divides, the branches separating at about an angle of 45°. The casting was 48x36 in., weighed 6594 lbs., and is believed to be the first of its kind.

As with electricity and compressed air, '98 has been a great year for the gas engine. The range of industries in which it finds practical place constantly widens in this and other countries. In Germany, which is a land of small industries, it has reached particularly wide distribution. In thirty-six German cities are now in operation 2323 gas engines used in 151 different industries.

THE Kennedy mine, Amador Co., is cited as an example of successful deep quartz gold mining in California. Many years ago it was sunk and worked in low-grade ore to a depth of 600 feet and then shut down because such ore in those days didn't pay to work. Subsequently it was reopened and sunk to a depth of 2400 feet, paying between \$2,000,000 and \$3,000,000 in dividends. In '99 it is to be sunk to a depth of 3100 feet, with assurance of still further success as a dividend payer.

ABOUT \$150,000 could or should be California's proper public contribution from the State Legislature for appropriate representation at the Paris Exposition; more might be necessary, but less would not be commensurate with the magnitude of the interests involved. That amount or any amount so spent should be looked upon as any first-class business establishment would view an advertising appropriation—as necessary and legitimate investment with view solely to its likelihood of producing satisfactory business returns.

HOW COMPLETELY men are creatures of environment and circumstance is well shown by the greatly decreased gold output of California for '98 because of the drought. With unusual activity, increased appliances, improved economical methods in every department of mining, opening of new properties and reworking of abandoned mines in every part of the State, the enforced idleness because of lack of rain has dried up many of the ordinary sources of the State's gold yield to the extent that the showing

for the year in gold yield will be a meager one. The one consolation is that the gold is here, the \$1,300,000,000 that California's surface has furnished being but an index of what is to be mined at greater depth, and that with a cycle of ordinarily wet winters sufficient water will be obtainable for all requirements.

THE fact that in gold mining there is no competition, no struggling for recognition, no striving for a customer, is cited by a correspondent as the reason for such frequent laxity in mine management, the absence of ordinary criticism and comparison "rendering unnecessary such customary business requirements." This novel view may be answered by citation of the patent fact that in all business pursuits results alone determine failure or success, and the absence of the necessity of securing a customer is in the case of mining more than made up by the necessity for constant skill, economy and intelligent action on the part of the mine manager; then, too, the element of chance enters largely into all underground mining, and adverse but unavoidable circumstances may upset the best plans. In every other line of business the standard is fixed: investors, owners and managers are thrown together and there is a constant interchange of information. In mining there is still left a little leaven of the ancient superstition that isolation and secrecy are "the proper thing." This, coupled with some self-sufficiency tends to detract from the fullest measure of success. "Everybody is wiser than anybody," and, as with managers in all other lines of business, so it should be more the rule among men at the head of mining enterprises to exchange information, and thus tend to reduce to the lowest minimum the element of chance that plays so important a part in the ever present problem of how to make the mine pay.

"I AM called a 'lucky' man, just because I leave nothing to luck," recently said a wealthy man to the writer. He argued that there was no such thing as "luck;" that every man was the architect of his own fortune; that the shrewd, calculating man saw clearly how things would go; what could and could not be sold; what would appreciate and what depreciate in value; that he judged men, their ability, weakness and capacity, and that it was folly to suppose that any chance or "luck" entered into the great game of commercial success, and that everything went by hard and fast undeviating rules as inexorable as the laws of nature. Probably he was right, yet, as we read last week of the death of C. A. Chapin of Niles, Mich., it occurred to us that that man's later years afforded an adverse answer to the wealthy San Francisco miner and a good illustration of what "luck" is. Many years ago C. A. Chapin had a little business in a little town in northern Michigan. He was no manager, failed, but honestly turned everything over to his creditors, most of whom lived in Detroit. When they met to effect final settlement one said, "Chapin is an honest man; I hate to turn an old man like him and his wife out on the world with nothing." Among the assets was a quarter section of rocky "no account" timber land near the town where Chapin had had his little store. This the creditors turned over to the old man to clear and try to get a living from. In clearing up the land iron ore was discovered; a Milwaukee, Wis., company agreed to develop the property without cost to Chapin, and pay him 50 cents per ton royalty on the iron ore produced therefrom. For several years that old barren 160 acres "timber land" yielded 80,000 tons annually, on which Chapin got annually \$40,000; then he reduced the royalty to 25 cents per ton, and the output grew to 400,000 tons annually. In the last years of his life his income from the mine that never cost him a stroke of work was \$100,000 annually. If this was not "luck," it was a happenstance that is usually given that name.

'98 HAS been a great year in the mining industry. It has an unequalled record, and the most of the operations have been honest and legitimate, working the mine and not the street. Decreased cost of mining machinery and supplies; improved methods of mining; cheaper and more general reduction processes; easier transportation; increased interest; steadiness of demand at fixed prices; absence of competition; a universal market for the product; the generally profitable character of the business—

these are a few of the causes that have made '98 the banner year in gold mining. The ruinous rivalry and profit-destroying competition that forces every other industry into a fierce battle for existence is not manifest in the gold-mining business; that, alone, helps all others and competes with none; it creates a market without crippling its own members, and gives a hundred other industries employment, while itself adding to the lasting wealth of the nation. It is the era of low-grade gold ore; of quantity rather than quality, where the owner or mine buyer looks as eagerly for large deposits of five-dollar ore as in the old days he sought for twenty-dollar ore. In the last few years machinery has rapidly reduced the ultimate cost of producing an ounce of gold, while the product has steadily maintained the same price—a fact unequaled elsewhere in the commercial world. "Scientific" mining is no longer sneered at. "Science" is only organized knowledge, and every success in mining is due to the application of such organized knowledge. Energy and capital, inclination and opportunity, have alike failed in mining unaccompanied by the practical knowledge and experience, the "sabe" that alone makes success assured.

CHARACTERISTIC of '98 in electrical progress is successful transmission of long distance high voltage. A Utah company for mining purposes transmits 40,000 volts thirty-five miles; a southern California company is about ready to transmit high voltage electric power eighty miles. Five or six years ago the transmission of 10,000 volts thirty miles was considered the possible limit. This has an intimate connection with progress in gold mining, as available power is one of the most important factors in that problem. New Zealand engineers figure on a possibility of transmitting 20,000 H. P. 180 miles. Cecil Rhodes, in South Africa, has a proposition to transmit electric power from Victoria Falls on the Zambesi to all the gold mines in Rhodesia, from 350 to 500 miles distant. It is understood that in the latter case 10,000 H. P. at \$375 per H. P. per annum would be a subject of contract. Still, the transmission of high voltage over such comparatively great distances is not a question that can be glibly discussed. There are not wanting electricians who now hold that in this the limiting commercial ratio is fast being approached. As the pressure rises the difficulty of successful transmission increases in inverse ratio. Of course, the question of distance, voltage, weight of copper and strength of insulation with the skill and intelligence of the human element may eventually be determined to admit of 50,000, 60,000, 70,000 volts transmitted 200 or 500 miles, but such tremendous probabilities involve equally tremendous risks and dangers. The question is one of interest to every gold miner, more especially in this west half of America, where every stream flowing from the mountains to the sea is a source of power, and where it is cheaper to carry power on a wire to where it is needed than to transport fuel. Thus it becomes a question of as much importance to the miner, the mill man and the metallurgist as any other economy in the profitable treatment of ore. The whole thing comes down to a question of cost. The Niagara Falls Co., which as the pioneer long distance concern took the lead in these things, has a schedule, which goes into effect to-morrow, which makes the cost to the consumer of 80 H. P. \$22.35 per H. P. per year, which, so far as known, is the cheapest power in the world, all things considered. When it comes to pass that a mining or manufacturing company can have 80 H. P. delivered to it continuously ten hours per day for \$150 per month, it will be a mighty evolution from the time that seems but yesterday.

DESPITE business depression, panics and war, and every other commercial disturbing factor, the installation of electrical power transmission machinery has progressed with marvelous rapidity. One of the largest companies installed in mining and power machinery alone 13,719 horse-power in 1892; 18,762 in 1893; 42,379 in 1894; 46,727 in 1895; 75,000 in 1896; 83,000 in 1897 and about 100,000 in 1898. This record, it should be remembered, is that of a single company and purely power transmitting apparatus, the numerous other applications of electricity not being included.

Concentrates.

IRIDIUM is worth about \$5 per ounce troy.

THERE are 1363 pages in the '98 issues of this paper.

SALINE lands cannot be entered under the desert land laws.

THE next meeting of the California Debris Commission will be on Jan. 9, '99.

THE H. P. hour is the unit of work or energy; it equals 1,800,000 foot pounds.

COLD weather has closed down every concentrator in the Cœur d'Alenes, Idaho.

TEN-FT. HEAD OF WATER gives an approximate pressure of 4½ pounds per square inch.

IN the new mining camp of Republic, Wash., it is estimated that there are 500 men employed.

STREAM TIN has long been known to exist in various parts of Montana, more especially at Clancy.

DRIVING a tunnel 5000 feet in length has begun on the Midland mining property at Brigham, Utah.

A 16-CANDLE POWER incandescent electric light requires about half an ampere current at 110 volts.

FIFTY-TWO issues is the usual number furnished our patrons for each year. This is No. 53, in '98, for good measure.

THOUSANDS of pounds of delayed mail for Dawson City, N. W. T., are reported lying at various northern points.

MULTIPLYING the head of water in feet by .0024147 gives as a product the H. P. obtainable from one miner's inch water.

THE net returns of the Homestake M. Co. at Deadwood, South Dakota for the year ending June 1, 1898, were \$3,505,170 20.

BEGINNING with '99, the California powder manufacturing companies resume the payment of dividends after a lapse of several years.

A GOOD SOLUTION for bichromate batteries is: water, 1500 parts; potassium bichromate, 100 parts; mercury bisulphate, 100 parts; 66° sulphuric acid, 50 parts.

T. A. McNEAL, Santa Fe foreman at San Bernardino, Cal., is locally credited with ability to perfectly weld copper, and temper it "so that a file cannot touch it."

AS to using mining machinery it is usually well to let some one else do the experimenting, and to get what has been proved to be effective in similar instances.

THE price of meals at Dawson has dropped to \$1, and there is no fear of starvation this winter. A large number of people have recently left the Klondike metropolis.

MICHIGAN charges \$12.50 to incorporate a new mining company, and the State Treasurer figures on \$15,000 fees in '99 from the incorporation of copper companies therein.

IF a patentee eventually finds himself justly entitled upon his invention to more than is secured by the patent already granted the safe and proper remedy is by a re-issue.

THE object of the patent law is to secure to inventors a monopoly of what they have actually invented or discovered, in view of which the statute will be liberally interpreted.

A NEW YORK dispatch reports the sale of fourteen claims in the vicinity of Jerome, Arizona, and known as the United Verde Extension, by N. W. Hull to Farrell, Greulich & Co.

"MORE gold at less cost than last year" is what Dawson and the Klondike report, being practically the same statement regarding the gold yield coming from all parts of the world.

LANDS containing petroleum or other mineral oils, and chiefly valuable therefor, may be entered and patent obtained therefor under the U. S. mining laws pertaining to placer claims.

A PIPE 3 feet long holds approximately as many pounds of water as the square of its diameter in inches; thus a 6-inch pipe holds approximately thirty-six pounds water in each yard length.

THE new Buffalo Hump mines are forty-five miles southeast of Grangeville, Idaho, via Florence. An unusually large quartz ledge carrying some rich gold ore, non-free-milling, is reported.

MINERAL lands in the forest reserves are subject to location and entry under the general mining laws, in the usual manner. The Yosemite, Cal., national park is not a "forest reserve."

FOREMAN KILGALLON of the Colusa-Parrott, Montana, was an expert witness in a mining case at Butte last week. Asked "What is a lead?" he answered, "A ledge of ore between two walls."

THE new California law allows sixty days after date of discovery for the purpose of marking the location of a mining claim, but no method of marking, other than that required by the U. S. Statutes is prescribed.

A MACHINE and its product cannot be joined in one application when they constitute different inventions; but, when being inseparable in their nature, they constitute one and the same invention, they may be so joined.

FOLLOWING the example of the Comstock companies, the Standard Con. of Bodie, Cal., will reduce its present capital stock of \$20,000,000—200,000 shares, par value \$100 each—to \$2,000,000: 200,000 shares, par value \$10 each.

THE time is going by when a man with a "prospect" can hope to get a big price for his undeveloped property; the gamble is being eliminated and it is getting down to legitimate business the same as any other commercial transaction.

WHAT an old blacksmith says is an excellent recipe for welding steel and iron is as follows: Carbonate of ammonia, ½ lb.; borax, 2 lb.; muriate of ammonia, ½ lb.; black oxide of manganese, ¼ lb. Beat up in a mortar and mix thoroughly.

RECALESCENCE is a phenomenon occurring during the cooling of a mass of steel, when it suddenly emits heat and grows more luminous for an instant. It is a phase of latent heat, and apparently marks the transition from a non-magnetizable to a magnetizable condition.

A PLACER patent carries all lodes not known to exist at the date of application therefor; should, however, a lode have been discovered within the placer location limits before such application it may be located, and the placer location to that extent would have to yield to it.

FIGURING the horse power needed to raise water to a given height, multiply the number of gallons per minute by 8.35; multiply that product by the number of feet the water is to be raised; divide that product by 33,000; the quotient will be the theoretical H. P., to which should be added about 30%.

ASSESSMENT notices, annual meeting notices, etc., may

legally be published in this paper or any other journal "of general circulation." Where obscurity or secrecy is desired, some medium not seen by the general mining community might suffice, though, if called in question, such quasi "publication" might not prove legal.

CONSUL MACRUM from Pretoria, South Africa, sends a report of the gold output of the South African republic, in which he says the October report shows that the number of mills and the total of stamps is rapidly increasing. It is expected that the gold output of the Transvaal next year will exceed that of the combined mines of this country, including Alaska.

THE California State law requires that on any lode claim located after May 26, '97, \$50 in work or improvements must be done sixty days after posting the notice. On any lode claim located after January 1, '98, the \$100 in annual assessment work necessary to hold it may be done any time during '99. A delinquent co-owner has ninety days from the last publication to pay up.

TO SET the weight on a safety valve lever, multiply the area of valve by the pressure carried and by the distance from the fulcrum; multiply weight of valve and stem by their distance from the fulcrum; multiply the weight of lever by one-half its length; subtract the two latter from the former, and divide the remainder by the weight of ball. The quotient is the distance from fulcrum to ball or weight on lever.

BADLY RUSTED IRON ARTICLES may be easily cleaned after twenty-four hours' immersion in a saturated solution chloride of tin. To keep machinery from rusting, take one ounce camphor, dissolve it in one pound melted lard; after removing the scum mix with it as much fine black lead as will give it an iron color; clean the machinery well; smear with the mixture. After twenty-four hours rub off, and clean with soft cloth.

THERE are no "blanket deposits" in Gilpin Co., Colorado. The veins cut obliquely across the foliation of the country rock. Occasionally ore is found occupying the line of lamination of the enclosing gneiss or schist, but no instance is known where ore occurring in that way has shown any great degree of permanence, nor are very flat veins found to be productive in that section, the vein of the Specie Payment mine being one of the rare exceptions.

THE Puget Sound Reduction Co. of Everett, Wash., has a suit pending in the Federal courts, on appeal from a decision of the board of appraisers, concerning the method of assaying. The smelter uses the fire test to determine the value of ores; the Government, in assaying samples to determine the percentage of dutiable lead, uses the wet test. There is a difference in the two methods of almost 3 per cent. The Reduction Co.'s method is practically its smelting process on a small scale.

THE term "inverted siphon" is applied to water pipe which follows the natural trend of great depressions in its course. There are many instances in California and elsewhere. The one most recently described herein is in Trinity county. One has just been completed by the Twin Placer Co., Idaho. An "inverted siphon a mile long" of wrought iron, 18 inches diameter, is a feasible proposition. With 400-foot head there would be approximately a pressure of 800 feet, or 400 pounds per square inch.

THE zircon, like the garnet, is of almost world-wide occurrence, and is found in granite, syenite, crystalline limestones, gneiss, chlorite and mica schists, and other rocks; also in basalt and pitchstone. Its composition is—silica, 33 per cent; zirconia, 67 per cent; its hardness is 7.5. It is found colorless, gray, pale yellow, green, red and reddish brown. When cut as gems, the nomenclature is according to the color. The transparent and red varieties are known as hyacinth, the colorless and smoke-tinted as jargon, and the gray or brown as zirconite.

PROBABLY the largest nugget or mass of silver ever mined was a piece weighing 1340 pounds, which was taken from the Smuggler mine, Aspen, Colo., in 1894. The nugget in question formed part of a consignment of 205,031 pounds of ore, which, with silver at 58 cents or thereabout, netted, free and clear of all expenses, close to \$3000. At Silver City, Idaho, is a mine which is said to have produced the richest load of ore ever sold in Denver. It brought, according to report, over \$80,000. Another from the same mine is said to have sold for \$60,000.

UNDER the constitution of the State of Colorado, mines were not taxed till March 14, 1896. The following year a law made all mines and mining property taxable. Any mineral-producing claim to the annual value of \$1000 is assessed on the basis of one-fifth the gross proceeds of the preceding year. Productive unpatented claims are also assessed. It is a partial Colorado custom to assess unproductive, unpatented claims at \$500 each. In California such claims are by custom assessed at \$100 each. Productive claims, patented or unpatented, are assessed at any figure the owner will stand.

AN automatic condensing engine takes from two and a quarter to three and a half pounds coal per H. P. per hour. A steam-jacketed compound condensing engine may, with extra good management, do with two pounds per H. P. per hour. Rightly managed, an average of thirty pounds water per indicated H. P. an hour will serve. A condenser helps greatly. The amount of injection water so required will run from twenty to twenty-five times the quantity supplied to the boilers. Estimating fourteen pounds coal per square foot of grate per hour, about eight pounds water is the rate of evaporation per pound of coal.

A PLACER LOCATION covering 160 acres is considered as one claim by the Land Department. When claims are contiguous each location is considered by the Land Department as a separate claim in patent proceedings, and \$500 worth of work on each claim is necessary; all may be patented under one application if adjoining each other. Eight individual locations are assumed to be united in each 160-acre lot. In thirty-two twenty-acre locations \$500 worth of work must be done upon each one to entitle the applicant for patent. It requires a separate application for each lot or location if these thirty-two are separate or cannot be joined.

THE best sample of mica from any coast mica mine received at this office this year came last Thursday from Dr. T. W. Helm, Bakersfield, Cal. The piece is 3x3 in., and of fair quality. Dr. Helm states difficulty in securing the services of one knowing how to properly get it out, and asks the value of sheets 3x4, 4x6, and 6x6 in. The value of mica increases rapidly with the size of the sheets procurable. Sheets 3x3 in. are worth \$1 per pound; 6x6 in., \$10 per pound. A. O. Shoemaker, the Palermo Mica Co., E. V. Munsell and J. D. Hague

—all of New York City—are dealers in mica of commercial value, and Dr. Helm would do well to communicate with those people.

IN the issue of the 17th inst., appeared the closing installment of a long technical paper on "the refining of base lead bullion containing silver, and high in gold," in which the author, discussing the method of parting down bullion, stated his belief that the process of parting which combined the qualities of quickness, cheapness and greatest efficiency with small plant expense was the Gutzkow process. It is of some interest to note that this process was invented thirty years ago by F. Gutzkow, then and now a resident of San Francisco, Cal., and that its survival and use in so many smelting establishments is good evidence through three decades of its practical value.

THE total output of gold in Japan in 1894 was 23,696 ounces; in 1895, 21,000 ounces. The quantity of silver mined in 1894 was 1,956,838 ounces; in 1895, 1,768,250 ounces. Silver mining in Japan is now at its height, while gold mining is somewhat declining. In the principal gold and silver mines machinery of American style is in use, while in copper and lead mines machinery of German pattern is employed. Only in the Ashio copper mine are electric motors used, steam being used in the important mines. There are in Japan six copper mines, yielding above 1,333,343 pounds per year. Copper is second in importance in the mineral industries of Japan, coal being first. There are in Japan six mines, yielding upwards of 1,330,000 pounds of copper each year.

THE effects of roasting sulphides are threefold: first, an alteration of obnoxious compounds into indifferent ones; second, the removal of sulphur, by which the ore grains become porous, and with it the fine gold and silver particles become accessible to solvents; and thirdly, a certain amount of fritting of the fine ore grains, which allows more rapid leaching afterward. If we do not roast "dead," the effects of course will be different. The last-named point will be the same; but instead of insoluble oxides we have a mixture of sulphates and oxides, as well as undecomposed sulphides, and therefore also a less porous product. If we could transform all sulphides into sulphates at the same time, little could be said against adopting such a method preparatory to cyanidation.

THE United States law does not require a locator of a mining claim to sink a 10-foot discovery shaft. It only requires him to disclose a vein or lode of ore in place. If a man sinks a shaft to any depth required by the local or State or Territorial laws, and then marks his claim and records it according to law, even though he has found no ore in place in his discovery shaft, and afterwards discovers ore in place in another part of the location, such discovery of ore is held to cure the defect of not finding ore in place in the discovery shaft, and the claim becomes good and dates to the time of original location. This does not apply to cases where any second locator has obtained conflicting territory by location between the dates of the first location and the discovery of ore in place.

AS to what constitutes a perfect location, Sec. 2, Act of May 10th, '72, Revised Statutes, says: "No location of a mining claim shall be made until the discovery of a vein or lode within the limits of the claim located." The time allowed in Colorado for perfecting title is sixty days to complete discovery shaft and thirty days more to survey and record location certificate. Mills' Annotated Statutes, Sec. 3154: "Any open cut, crosscut or tunnel which shall cut a lode at a depth of 10 feet below the surface shall hold such lode the same as if a discovery shaft were sunk thereon." Colorado statutes require 10 feet depth at least. Morrison, page 36: "If a crevice does not show in 10 feet the shaft must go deeper; if it appears sooner the 10 feet must still be completed." The assessment work is that done in the discovery shaft, and the annual labor is the \$100 worth of work performed annually thereafter.

GOLD does change in value, but less than any other commodity or material. Gold and silver are not like other commodities in responding to the law of supply and demand, for there is very little loss of gold and silver. The work they have done one year they can do a second and a third year, and almost indefinitely. So an increased demand for gold finds always practically as much gold on hand as there was before the demand began, plus any increase of stock from the mines. So, too, a decreased demand has practically no effect on the stock of gold, which cannot be destroyed or sold at "bargain rates." There is some change in the value of gold. It decreased after the discovery of America, when the Spaniards captured Mexico and Peru; it decreased again after the discovery of gold in California and Australia. But, compared with a day's work of an unskilled laborer, the value of gold has changed less than that of any other commodity.

THE capacity of a pump is measured by the greatest amount of water it can deliver per day; thus, a pump of 3,000,000 gallons capacity is understood to be one that can raise 3,000,000 gallons of water in 24 hours. This gives, however, little idea of the work done by the pump unless the height of lift or the pressure that it maintains is also stated. A pump of 3,000,000 gallons capacity lifting water through a height of 100 feet becomes merely one of 1,500,000 gallons capacity if the height of lift is 200 feet. The power of a pump is the number of H. P. it can deliver; one H. P. is the performance of 550 foot-pounds of work in one second. Thus, if 1,200,000 gallons of water is to be raised through a height of 230 feet in 24 hours, the weight to be lifted in one second is 116½ pounds and the power required is 48.6 H. P. The effective power of the pump must, however, be considerably higher than this, as work is lost in overcoming the frictional resistances due to the flow in the pipe as well as the pump cylinders.

THE idea of annual assessment levied on an unpatented mining claim is to keep the claim from lapsing. It won't amount to anything "to just keep the title up." If the locator doesn't think the claim worth working or patenting, he need spend no money on it at all; and if others are of the same opinion, and don't "jump" or relocate it, he can save all assessment work, take his chances as to relocation and not do anything. When he gets ready to work the claim he will have as good a "title" to it (if it be not relocated) as though he had put \$100 or \$1000 worth of improvements on it each year. He might do required annual work for ten years, and if he missed one year he would have no better "title" than if he had never done a stroke on it. However, if a claim is worth holding it is worth patenting and developing, particularly the former, and the better way is to get a U. S. title to a mining claim as speedily as possible. If the owner should want to sell, a government title is a great aid.

Mistakes in Mining.

By EDMUND B. KIRBY.

* * * * *

At the head of the list might be put the mistake of not letting go soon enough. It is a wise man who knows when he is beaten. It is never justifiable to risk money unless the chances are decidedly in favor of success. As soon as they cease to be so it is time to shut down the mine and confess failure. Dogged persistence and determination are grand virtues in some fields, but ruinous vices in this. If the investor intends to continue mining he should transfer his risk to some other mine where success is again probable. Out of a number of such ventures he may expect to win some. If \$100,000 has been spent fruitlessly and it is a question of putting in \$10,000 more, the real issue should be whether the \$10,000 can best be risked on this mine or on some other venture. What is already lost should not affect the decision. Good judgment as to when to quit is therefore highly desirable for the investor's interest. Unfortunately for him, however, it is quite the contrary with all others concerned. It is expecting too much from human nature to assume that men will put an end to their own jobs.

The most important duty of mine management is, of course, the proper direction of development work. Pay ore bodies must be discovered in the first place, and even in pay mines new bodies must be found to replace old ones as they are worked out. The fate of the mine depends on the success of this work, and it generally calls for the highest quality of skilled judgment. It therefore presents unlimited opportunities for errors, which are, however, rarely noticed by owners. Such errors count up rapidly, because it costs \$6 to \$15 per foot to move horizontally and \$20 to \$50 to move vertically underground.

They would be less apt to occur if more attention was given to the structure of ore shoots. These are generally understood to be those limited belts or portions of veins and other ore deposits which are specially productive and are thus distinguished from the rest. A shoot may be a continuous body of ore or an irregular string of bodies separated more or less by barren ground. In most gold and silver ore deposits the pay ore shoots are merely the main channels of flow through which the mineral bearing solutions found their easiest passage as they rose from the depths below to escape at the surface. Shoots are generally fairly continuous down to a depth where the pressure or other conditions at the time did not favor ore deposition. They then play out; either the grade or the quality of ore falling below the pay point. The structure of shoots is too complex a matter for discussion here. In general it may be said that their peculiarities are always what might be expected from their origin. For instance, they are apt to stand nearly up and down along the rise or dip of the ore deposit, and are found quite a distance apart.

Notwithstanding these simple and well-known facts, it is common to see large sums spent in hunting ore along the edges of some worked-out ore shoot. In other cases the barren vein areas between shoots is explored by the same close and expensive network of shafts, winzes and levels that would be used within the areas of the shoots themselves.

Since shoots stand up and down in a vein, there is more chance of striking one by horizontal than by vertical workings. Incidentally the former are also much cheaper. Notwithstanding this, the chief hopes in development work are apt to center on the shafts and winzes, because these gain depth. The old and never-dying delusion that mines improve with depth is partly responsible for this. As a matter of fact mines improve when any working gets into an ore shoot.

But every little while some shaft headed for the earth's center chances to run into a shoot on its downward slope. The same shoot might have been found with little delay or expense by a short level from the shaft while it was shallow. In fact, it may have come to the surface and a little skillful prospecting would have exposed it there at the beginning of operations. Nevertheless such strikes are always heralded as proof of the depth theory.

When mining in fissure veins, a large part of the development work is often wasted by being "run off the vein."

As every mining man knows, the filled and cemented fissure which constitutes a vein of this class is not often a simple, clean-cut break. Like any other fracture in a solid mass, it has branches, crossings, side bows and parallel crevices in every conceivable form. These may be distributed through a width of 20 to 100 feet, and are more or less connected by interlacing crevices.

It is not easy, and is sometimes impossible at first sight, to distinguish the principal ore-bearing fracture or "main vein" from the others. At every split there is a chance of following the wrong clew, and the sum total of such errors in a single mine is sometimes appalling.

The difficulties are increased by the fact that an ore shoot frequently jumps from one crevice to another, and mine levels, therefore, pass by it. In addition to the difficulties of identifying the main crevice of one vein are those which come from the

existence of other veins close by. Every time the vein must be reached anew by a lower shaft, crosscut or tunnel there is danger of mistake. There are no tags on veins, and a large expenditure of good money on the wrong one is a familiar sight.

Next to skilled judgment, the best safeguard while following or intersecting veins is the judicious use of crosscut work. Whenever doubt exists, this should be extended far enough to include other crevices and give decisive information. Generally speaking, one crosscut in the line of an ore chute is worth a dozen elsewhere. Well-designed mine maps, with plenty of sections and kept up with the work, are always necessary for good work underground. This is particularly the case in irregular or complicated ore deposits. Nevertheless it is not uncommon to find large mines operating without maps or with a mere apology for one.

The danger to an enterprise of crosscut tunnel work has become proverbial in the mining world. Nevertheless these are still seen everywhere and do not seem to be any less popular than in past years. Those really needed to drain some heavy water flow and driven by some mine for its own development, are often wisely planned. Others, and especially custom tunnels, have generally been financial failures.

Among the many reasons for this are the heavy cost, the long delay, the short life of mines, and the difficulty of persuading or forcing the owners of other mines to pay an adequate return for benefits received. An underground system of connections is a very expensive way of reaching ore bodies irregularly scattered over a large territory.

It is easier to travel over the surface. As a rule mine owners find it cheaper and quicker to do this, and to discover and work these ore bodies through their own shafts. The prevailing idea that hoisting costs more than to tram ore through a tunnel is often wrong and will not stand the test of exact figures.

When it comes to the minor details of work, there is much room for economy by improving the usual system of ventilation. This system is to continue the working in question, say a level, until the mixture of hot breath, candle gas and dynamite fumes gets clear beyond human endurance and the men kick.

Then a hand-blower and 5-inch air pipe are provided and they are invited to amuse themselves at this apparatus whenever they don't like the breast. After this resource has been worked to the limit and progress becomes so slow as to worry the superintendent, an air connection is ordered. This is driven through solid ground to the nearest parallel working and everybody is then ready to start the process over again.

The cost of these solid rock air connections in a mine is generally enough to pay many times over for a good ventilation plant. It seems hardly necessary to mention the lost time, the inefficiency of labor, the slow progress and the immoral effect upon any self-respecting man who has to stand such conditions.

But all this waste is concealed in the payroll and is invisible to many people. If properly planned, simple and not very expensive apparatus will provide pure air in every heading. When this is attempted the system generally adopted is that of forcing air. This is wrong in principle, and in almost every case the exhaust system should be employed. Steam, compressed air or electricity can be used as power. In the absence of power a hot air column can be made to meet any ordinary requirements.

Mills built before an ore supply was secured stand all over the West. So much has been said upon this subject that it seems unnecessary to mention it here.

But an extensive experience has convinced the writer that such mistakes do not belong to a past era. Unfortunately, they appear to be as frequent as ever. A certain proportion is due to ulterior objects, with the purpose of enriching some individuals at the expense of others. Being successful in this, they can perhaps hardly be classed as mistakes. Others are due to mistaken information on the cost of mining and the real average value of discovered ore.

The cost of mining is purely a question of book-keeping. It is figured in just as many ways as there are individuals. Hence, as stated by mining men, it may vary from a few cents to thousands of dollars per ton. These differences of opinion arise from the different ways of treating the general expense and development accounts.

If a mine spends \$20,000 one year and extracts two tons of ore, what did this cost per ton, \$10,000 or \$2? How about the next year, when 4,000 tons are produced for \$20,000? It is the sacred prerogative of every mine owner and superintendent to figure this to suit himself and issue statements accordingly.

To many people it seems a very simple matter to ascertain the true average value of discovered ore in a mine. Full information on this fundamental fact of the business is plainly as important as the accounts in a commercial house. It is therefore naturally supposed that every man who owns a mine or is in charge of mining work must know accurately what he has.

There are, of course, plenty of well managed mines where this assumption is correct.

In most cases however, it is not. One reason is

that there is no royal road to the correct sampling and measurement of ore bodies. If done improperly the results are liable to dangerous error. The work is very laborious and expensive and requires an unusual degree of skill and judgment. Moreover, accurate figures of this kind ruin too many "good mines."

There is plenty of room for improvement in the details of mining work. Aside from the leasing system, which has its own field, the best economy is to be secured only by using the contract system. This system is spreading slowly but too slowly. Even in districts where its value is acknowledged for driving headings there is apt to be a prejudice against its use for stoping. The long practical experience of various districts in the world proves that most of the stereotyped objections to this are not valid. There are few cases where it is not possible to devise some way of paying for stoping also, by the amount of work done. This, however, requires more skill in arranging details, closer attention from superintendent and foreman and good management of the men. Without these conditions contract stoping in difficult ore deposits is apt to fail.

It would benefit the industry if more attention were directed to the best methods of sorting ore. It is evidently important to get rid of worthless material at the mine so far as possible. Moreover, rich ore ought not to go with the low grade to ordinary milling processes. Care in these details will frequently make all the difference between loss and profit.

With the high-priced labor of the West, however, the cost and quality of sorting done is far from satisfactory. The primitive Mexican methods, with hammer and stone, are still in general use.

Expensive labor ought to have the assistance of some machinery, and at least of convenient apparatus for its work.

A properly designed sorting plant, either alone or as part of a mill is not expensive. Simple crushing, screening and washing machinery with stationary or traveling picking tables, will permit a quality and quantity of work impossible by present methods. If a mine cannot afford a complete plant, it can at least put in something to assist the hand work.

Compressed Air.

A discussion took place recently at the International Mining Congress at Brussels as to the limits of safety to which work can be carried on under compressed air. The Austrian doctors declared that men under twenty and over fifty years of age should not be allowed to work where the air pressure was high, and in all cases medical certificates should be forthcoming as to the soundness of the heart, lungs, and the vascular system. An ear affection, a cold or gastric attack should be sufficient for prohibition. The limit of pressure should be seventy-five pounds, which would enable the work to be carried on under water at 170 feet from the surface, but in such cases special precautions would be necessary in returning from the high pressure to the normal condition. The minimum would be 100 minutes, but the men may continue to work for any period. It is one of the peculiarities of working under high air pressure that healthy men might almost live in the pressure chamber, but the change from high to lower pressure should take one minute for every one and one half pounds of pressure. Men accustomed to the work might take only ten minutes for a pressure of twenty-two pounds, fifteen minutes for thirty-seven pounds, or thirty minutes for a seventy-five-pound pressure. It is suggested that the men in passing through the changes of pressure should suck sugar; not that sugar possesses any particular virtue, but it insures the swallowing of the saliva and prevents the tympanum from being injured. As to the ventilation of the working chamber, the air should be renewed at the rate of 700 cubic feet per head per hour.

REFERRING to the article "Concentration After Lixivation," on page 659, since that part of the issue of this date was printed Mr. Alderson writes: "At Rochester, Montana, E. Mueller concentrates his material after leaching it with cyanide because of lead in the ore with which the gold is chemically combined. The lead concentrates are shipped to smelter for treatment. Many people seem to think ore cannot be cyanided which contains any lead. The above certainly affords proof to the contrary."

At New York City last Wednesday the American Chemical Society was shown by C. E. Triplar, liquid air with a temperature below 200 below zero. A diamond was consumed therein, giving forth "fierce light." Experiments with liquid oxygen and a magnet showed that the substance was highly susceptible to magnetic influence.

In the issue of the 10th inst. was illustrated and described the excavator used by the San Francisco Bridge Co. in constructing an irrigation canal in Colusa Co., Cal. It has been subsequently learned that the elevator dredge so used was designed and built by the Bucyrus Co., South Milwaukee, Wis., in 1890.

The Duplication of Drawings.*

Half a century ago, the engineer and architect were entirely dependent upon tracing paper and draftsmen's skill for the production of duplicate copies of working drawings. The necessary tracing and retracing of every plan, until the required number of copies was obtained, made the expense very great, and it is no wonder that the introduction of a process by which drawings could be duplicated at one-tenth the expense of tracing was enthusiastically received.

It was in 1843 that Sir John Herschel, while experimenting in photography, investigated the effect of light on various iron compounds, and afterwards perfected a method of photo-printing which he called the cyanotype.

The cyanotype was nothing more than a primitive form of the blueprint process. The lack of facilities for obtaining pure chemicals made the preparation of the paper somewhat difficult in those days, but the resulting material was precisely the same as the commercial blueprint paper of to-day.

The application of the cyanotype to the reproduction of working drawings revolutionized drafting-room practice. The danger of error due to oversight in tracing was reduced to a minimum, and the great labor of carefully checking a large number of duplicate tracings was obviated entirely. A carefully plotted drawing, and an accurately traced copy, were all that was required of the draftsman, while an unlimited number of duplicates could be turned out by the bluper, each copy being precisely like the original tracing, so far as the relations of lines and dimensions were concerned.

But it is contrary to human nature to be content with but a single improvement. It is a strange but well demonstrated fact that man will plod along, contented with the most primitive ways and methods, for at indefinite period; but just as soon as some one shows him an improvement on his methods, he eagerly accepts the improvement, and demands, at the same time, something still better.

It was the same with blueprinting. Architects and engineers were delighted with the process, for they found that it not only saved them much labor, but trebled the output of their drafting rooms. Soon, however, they demanded something more. The blueprint was a negative copy of the drawing; that is, the lines were white on a colored ground, while in the original tracing the lines were black on a white ground. This, however, was not entirely satisfactory, and when, finally, several processes were invented, each of which gave a reproduction of the original, in black lines on a white ground, the impatient practitioner complained of the trouble and expense involved.

Everything has been done to perfect these photo-printing processes, and at the present day there is little room for improvement. The one disadvantage of all of them lies in the fact that sunshine is necessary for the printing, and unless the day is bright, little or no printing can be done. For this reason several attempts have been made to devise a mechanical method of reproducing drawings, which shall be independent of weather conditions, and at the same time simple and inexpensive in operation. So far, these attempts have been only partially successful, though, for some purposes, fairly good results may be obtained.

The simplest of all the photo-printing processes is the cyanotype, or blueprint, the paper for which may be prepared as follows: In a dark-colored or opaque bottle dissolve two ounces of citrate of iron and ammonia in eight ounces of water, and in a similar bottle dissolve one and one-quarter ounces of ferri-cyanide of potash in eight ounces of water. Immediately before use, mix equal portions of these solutions, and, by means of a soft sponge, a wad of cotton, or a camel's-hair brush, spread the mixed solutions evenly over the entire surface of a heavily sized white paper. This must be done in a room lighted with gas or other artificial light whose color tends toward yellow, and the paper should be dried quickly in a dark room or closet. The tracing is laid on a sheet of heavy glass (or preferably in a printing frame) with the drawing next the glass; the prepared paper is then laid over the tracing with its prepared side against the tracing cloth. A piece of heavy blotting paper, or felt, is then laid on the back of the paper, to distribute the pressure and keep the tracing and printing paper in close contact; a board is then placed over the felt, and the whole is submitted, glass side up, to the rays of direct sunlight. In from three to ten minutes the print is removed and washed in clean water, when the entire surface becomes a deep blue color, except at the points protected by the lines of the tracing, where the paper will remain white.

After washing, the print is hung up and allowed to dry, when it is ready for use as a working drawing. Any desired alterations in the print may be made with an ordinary writing pen and a solution of

caustic soda. This solution, applied to the blue portions of the print, will immediately bleach it white, while any existing lines may be obliterated by means of a little Prussian blue water color, or even an ordinary blue pencil.

The printing frame for use in the making of sun prints consists of a rectangular frame, or box, as shown in Fig. 1, on one side of which is fixed a pane

FIG. 1.

of clear plate glass *a*. The tracing is then laid in the frame against the glass, as shown at *b*, and the printing paper next, as shown at *c*. A felt pad *d* is then spread over the back of the paper, and the wooden backing *e* is put in, to hold the paper and tracing against the glass. The arms *f* are then turned down, and the springs *g*, pressing against the cleat *h*, keep everything tight in place, while the catches *k* hold the arms down. The frame is then turned over, and so placed that the sun may shine through the glass and tracing on to the printing paper.

The backing is usually made in two or more pieces, as shown, in order that the frame may be partially opened and the progress of the printing examined, while one of the arms is still clamped down and secures the end of the tracing and paper from slipping. If the print is then found to be insufficiently printed, the back may be replaced and the exposure continued.

When the printing frames are large, and not easily

FIG. 2.

handled, it is customary to build a track out through a window, as shown in Fig. 2. The frame is then provided on each side with a flangewheel *a* for running on the track *b*. When the frame is taken in to remove the print, or to put in a new tracing, it is simply turned over on the wheels, as shown by the dotted lines. The back is removed, the tracing and paper adjusted, and the back replaced. The frame is then turned glass side up, pushed on the track, and left in the sun till the printing is completed.

Next in simplicity to the ordinary blueprint process is the blueline process, whereby the reproduction shows in clear blue lines on a perfectly white ground.

The paper is coated with the following solution:

| | |
|---------------------------|---------------|
| Gum arabic..... | 385 grains. |
| Perochloride of iron..... | 123 grains. |
| Tartaric acid..... | 62 grains. |
| Sodium chloride..... | 46 grains. |
| Water..... | 3 1/4 ounces. |

When dry, the paper is exposed under a tracing, as in the previously described process, and, when sufficiently printed, is immersed in a saturated solution of ferrocyanide of potassium until the lines are fully developed. It is then rinsed in a dilute solution of hydrochloric acid, to remove any yellow stains due to the ferrocyanide, and is finally washed in water.

Alterations in the finished print may be made with an ordinary pen and a rather thickly ground solution of Prussian blue water color. Existing lines may be removed with the soda solution previously described.

The processes for printing black lines on a white ground are numerous, but somewhat complicated. One of the earliest forms consisted of a process of double printing, and, though more complex and expensive than later methods, it gives results that leave nothing to be desired.

A sheet of thin but close-grained paper is im-

mersed for half a minute in a solution of common table salt and then dried; it is then brushed over with a solution of ten grains of nitrate of silver in one ounce of water, and again dried. The paper is then exposed under the tracing and printed until the lines just commence to change color, while the ground becomes a deep bronze color. The print is then soaked for ten minutes in a solution of one ounce of hyposulphite of soda in ten ounces of water, and afterwards well washed in water and dried. When dry, the print is rubbed over with sweet oil, to render it transparent, and is then put in the printing frame in the place formerly occupied by the tracing. A new print is now made under the oiled copy, and this second print is soaked in the soda solution and washed in water, the same as the first one. The result is a clear white ground, on which the lines of the drawing are duplicated in a deep bronze black, equal in every respect to an inked drawing. Any number of prints can be made through the oiled copy, but the process is so troublesome, and takes so much time, that it never found much favor except for special work and small sizes of drawings.

A paper for direct printing of black lines on a white ground may be prepared as follows: In nine ounces of water dissolve

| | |
|------------------------------------|----------|
| Gelatine..... | 3 drams. |
| Perochloride of iron solution..... | 6 drams. |
| Tartaric acid..... | 3 drams. |
| Ferric sulphate of iron..... | 3 drams. |

Apply two coats of this solution to the surface of a heavy sized paper, allowing each coat to dry thoroughly. Print as usual, under a tracing having somewhat heavy and well defined lines, and develop the print in a solution consisting of six drams of gallic acid dissolved in thirty-two ounces of water and six and one-half ounces of alcohol. The lines will appear strong and of a deep purple-black color, and the ground will assume a cream tint, afterwards changing to a pale gray. The print should then be washed in several changes of water and hung up to dry. Additional lines on this form of print can be made with ordinary drawing ink; existing lines can be removed only by careful rubbing with an ink eraser.

The quality of any print produced by the agency of sunlight is dependent very largely upon the tracing from which it is made. The lines of the original should be strong and of an even density, and the ink used should be absolutely opaque.

The best results are obtained when the ink with which the tracing is made is mixed with a small quantity of thickly ground chrome-yellow water color. If the color refuses to mix freely with the ink medium, a drop of ox-gall will clear it and cause it to flow more freely—though too much gall will give it a tendency to blot.

Regardless of the numerous disadvantages, nearly all mechanical drawings of the present day are reproduced by some one or other of the sun-printing processes. There is, however, an increasing tendency among users—architects particularly—to adopt the more recent method of printing by means of mechanical transfer. This consists of making duplicate copies of an inked drawing or tracing by placing it in contact with some prepared surface that will absorb a portion of the inked lines, and afterward transfer them to other sheets.

The disadvantage lies in the fact that the ink necessary for the purpose must be colored with an aniline dye, thus becoming very difficult to handle and dirty to use. It has a corresponding advantage, however, inasmuch as different parts of a drawing can be made with different colored inks, and the copy will show these color relations.

The materials necessary for the transfer process may be prepared as follows: Soak four ounces of white glue in five ounces of water and three ounces of strong aqua ammonia. When the glue is soft, warm the solution, by setting the vessel containing it in a pan or pail containing boiling water. When the glue is dissolved, add three ounces of granulated sugar and eight ounces of gelatine; then let it come to the boiling point until the whole becomes liquid. While still hot, paint the solution on sheets of heavy white blotting paper until the latter is thoroughly saturated; then lay them away to dry, for two or three days.

When ready for use, slightly moisten the surface of a sheet with a sponge dipped in cold water, and lay the drawing or tracing (which has been executed with the prepared inks already described) over the pad so that every part of the inked lines comes in contact with the sheet. Rub the drawing on the back into close contact with the prepared blotter, and after two or three minutes carefully remove it. Sheets of plain white paper laid over the pad and gently rubbed into contact will receive a complete impression nearly as clear as the original; from six to ten copies may be thus obtained from a single impression. After use, the pad should be laid aside for twenty-four hours, after which the ink will be found to have sunk into the blotter and a new drawing may be transferred. The pads should be kept in

*L. Osborne in Home Study Magazine.

a horizontal position on a shelf or in a drawer, away from heat and dust.

The inks required for these pads may be mixed as follows:

| BLACK INK. | |
|----------------------|------------|
| Aniline black..... | 1 ounce. |
| Water..... | 14 ounces. |
| Glycerine..... | 4 ounces. |
| BLUE INK. | |
| Aniline blue..... | 1 ounce. |
| Hot water..... | 7 ounces. |
| Add, when cool, | |
| Spirits of wine..... | 1 ounce. |
| Glycerine..... | 1/4 ounce. |
| Ether..... | 10 minims. |
| Carbolic acid..... | 1 minim. |

Red, violet, or green ink may be prepared by substituting the desired color of aniline for the one mentioned above.

Automatic Air Compressors Adapted for Electric Motors.

Written for the MINING AND SCIENTIFIC PRESS.

For the economical and proper operation of an air compressor something more is demanded than that it shall compress its air economically when running

case, when the receivers have been filled to the required pressure the constant speed compressor will discharge the excess of air through a safety valve into the atmosphere, and the work in compressing this air so discharged is, of course, lost, there being a proportionate wear on the compressor to do this lost work.

There are means employed by compressor manufacturers to switch out the full load when the pressure in the air receiver has reached a certain point, but this constant switching in and out of the full load, especially in large machines, has a bad effect upon the line current, and frequently upsets the governing mechanism at the electric generating station, giving the whole system a see-saw motion and also interfering with the steadiness of the lights; in fact, where lights and power are delivered from the same line, it would be a cause of serious complaint to drive a compressor from it that was continually switching in and out from nothing to full load.

The ideal compressor, to properly overcome these objections and difficulties, is one which will automatically cut itself out by increments, as the demand for air increases, and when the demand for air

is placed upon its main shaft and is 30 feet in diameter, operating under a single jet with a pressure of 775 feet. The electric motor, which may be connected or disconnected to the main driving shaft of the compressor by cut steel gears of large size, is a Stanley synchronous motor, of 440 H. P. The small water wheel shown on the left of this motor is a starting motor for the generator, or may be used afterwards to drive the motor as a generator, to furnish power for pumping in the mine, should it be required.

The compressor itself consists of two low-pressure, single-acting cylinders, 30 inches in diameter by 30-inch stroke, which receives the air from the water wheel pit and compresses it to about 25 pounds to the square inch. This air is forced through pipes of large diameter, through the inter-cooler, which it will be noticed is situated in the water wheel tail race, where the spray from the water wheel will assist materially in cooling the air. The heat in the first stage of the compression is taken out of the air and it then passes to the high-pressure cylinders, which are 18 1/2 inches in diameter and 30-inch stroke. In these the air is further compressed to 90 pounds

THE RIX VARIABLE VOLUME AIR COMPRESSOR, NORTH STAR MINE, NEVADA COUNTY, CAL.

at a given speed. With the advent of the numerous electrical transmissions which have been installed in the State of California there are conditions and requirements imposed in the use of power which make it imperative to construct a compressor which shall work properly under the new conditions.

At first sight it would seem that it is only necessary to either belt or gear a compressor to the electric motor and that the installation is then complete, but it happens that in the use of alternating currents, which are exclusively used for high potential transmissions, the motors run practically synchronously with the generators; in other words, the motors are constant speed motors, and these motors will not start at full load, and synchronous motors cannot be started for work unless in synchronism.

It will readily be seen that where a motor is driving at a constant speed the compressor is naturally delivering its full quantity of air. If it were possible to exactly calculate the amount of air required for use, there would be no objection to constructing a compressor to deliver this quantity at this constant speed. But the most work done by compressed air in the State of California is intermittent work, which varies from about 15 per cent of the capacity of the compressor to full capacity. This being the

ceases; it will have cut out the entire machine and will as automatically decline to deliver air when the occasion demands and gradually restore the delivery of the full volume, if such be required. All this must be done in the most gradual manner, covering such a period of time that it will not interfere with the harmony of the electrical installation. This cut-out device must also be so constructed that it can be installed and conveniently operated for the starting of the compressor. It will be readily seen that this must be accomplished by constructing such a valve mechanism that it will deliver from the cylinder the whole of its contents or any portion that may be desired. In other words, the cylinder and the valve motion must be capable of delivering a variable volume when running at a constant speed and constant stroke.

The new compressor which is now being installed at the North Star mine at Grass Valley, Cal., was built to meet the conditions as set forth above. This compressor, as shown in the accompany cuts, is arranged so that it may be driven either by water power or electrical power. The water wheel, which is the largest tangential water wheel in the world*,

*An illustrated description of this wheel appeared in the issue of October 15th, '98.

to the square inch and forced into the mains leading to the mine.

This compressor will make about sixty-five revolutions, which slow piston speed insures economy of compression.

The entire construction of this compressor—both the frames and shafting, gears and everything pertaining thereto—is massive in construction, the total installation weighing about 100 tons. This compressor, as stated before, running at a constant speed, will automatically deliver a volume of air at the final pressure from 15 per cent of its volumetric capacity to its full volume. This means, of course, that as the power demands increase it will automatically give forth additional air. Inasmuch as the motor governs itself, this general combination will make an economical plant.

The small cut, showing a double-acting valve motion, is the vertical elevation of the cylinder of the compressor, of a similar kind to the North Star, which is now being installed at the Jumper mine, Tuolumne county, Cal. This compressor will be a duplex compressor, having 15-inch diameter cylinders by 30-inch stroke, each cylinder double acting. This will be driven by a 150 H. P. Westinghouse induction motor, making a constant speed of 640 revo-

lutions per minute. The power will be transmitted from the motor to the compressor through a mortise maple tooth gear, of very large diameter and extreme width of face, the driving pinion being a cut cast iron pinion on the motor shaft. The mortise gear will insure a certain elasticity of motion that will withstand the shock of the compressor and will be comparatively noiseless. This compressor will, like that of the North Star, be capable of automatically cutting itself out as the demand for air decreases, until it reaches about 12 per cent of the volumetric capacity of the cylinder.

The governors on both of these compressors are under the control of the pressure in the air receiver. The variation of this pressure above the required limit, which in both these cases is 90 pounds, will change the position of the trip cams that control the opening and shutting of the inlet valves.

The inlet valves in both of these machines are of the Corliss type, giving 10 per cent the area of the cylinder for the induction opening, which is almost double that which can be introduced into an air compressor with poppet valves. This variable motion

Concentration After Lixiviation.

Written for the MINING AND SCIENTIFIC PRESS by
MATT W. ALDERSON.

The usual practice when ores contain sulphides or values in concentrated form not easily dissolved by cyanide is to remove such particles before leaching. One would naturally expect them to be more valuable before any part of the precious metals was removed than afterwards. Conditions, however, may alter cases, and conditions are not the same at Cripple Creek, where concentration follows cyaniding, as in South Africa, where it precedes it.

The ores of Cripple Creek and vicinity contain tellurium, and, to use the words of a prominent chlorinator (C. C. Burger): "As is well known, it is not possible to satisfactorily concentrate tellurium ores; when such material is crushed, through a twenty to forty mesh screen, the values will float off any vanner or concentrating machine ever devised."

When ores containing tellurium are roasted, con-

comes in easily and naturally. At the Brodie mill concentration is effected by the use of four Wilfley tables.

At the mill of the Colorado Ore Reduction Co., at Elkton, the leached pulp passes through a tailings launder 2 feet in width and about 20 feet in length, having Hungarian riffles in the bottom. From thence the tailings continue over blanket concentrators. Results have been very satisfactory and the management claim better work is being done than by any other system in use in the district.

The mill of the Metallic Extraction Co., at Cyanide, is on level ground. The tailings, as they are discharged from the leaching vats

Fig. 2

SECTIONAL VIEW AIR COMPRESSOR, NORTH STAR MINE, NEVADA COUNTY, CAL.

applied to air compressors is the subject of a recent patent by Edward A. Rix of San Francisco, Cal.

THE Nicaragua Canal Commission has completed its preliminary report, estimating 75,000,000 cubic

conditions are changed, the process of roasting—where sulphur, antimony, tellurium, etc., are driven off—being in one sense that of concentration. If the ore was in a wet state at the completion of the roasting, concentration might take place then to excellent

are elevated by a centrifugal pump and flow away from the mill through an elevated launder, in the bottom of which are Hungarian riffles. The ore at this mill is crushed to thirty mesh, and, as better results were secured than at cyanide mills in the district where the ore was crushed to but sixteen to twenty mesh, concentration was not attempted until recently. Results were so satisfactory, however, that all material passing the mill will be concentrated hereafter, and it is in contemplation to concentrate the accumulated tailings.

All the above mills are cyanide mills, treating the refractory ores of the mines of Cripple Creek and vicinity. The value of concentrates obtained is about the same at each mill, varying according to ore treated, to some extent, and ranging in value from two to seven ounces of gold to the ton.

Readers of contributions to mining journals must have been impressed with the statements so frequently made therein that a considerably better extraction can be secured by chlorination than by cyanidation, but one does not often have the opportunity of seeing plants using these two processes at work on the same ores, as in Colorado. The cyanide mills, in treating \$20 ore, make an extraction of about 90 per cent. This leaves, prior to concentration, about \$2 in the tailings. One seldom sees claims of less than 96 per cent by chlorination. This, if applied to the Cripple Creek mills, would be leaving 80 cents in the tailings, prior to concentration. What is the result? Some one discovered that there were good values in the chlorination tailings, and those values are being saved. And even after saving what can be saved by concentration, there is many a ton of tailings which will still assay as high as 80 cents. The process has not yet been invented whereby one may save all the values of any ore.

At the El Paso Reduction Co.'s mill at Florence, Colorado, are seven concentrators; at the Gillette

Fig. 3.

VERTICAL ELEVATION CYLINDER AIR COMPRESSOR, JUMPER MINE, TUOLUMNE COUNTY, CAL.

yards of all grades of cutting to Lake Nicaragua. The cost of the Ochoa dam, upon which rests the entire feasibility of the route, was not satisfactorily computed, as the undertaking is of so colossal a nature as to be beyond figuring. The dam will be over 1500 feet in length, its foundation 75 feet below the bed of salt in the river bottom and its rise over 130 feet; \$135,000,000 will be a conservative estimate of the entire cost of the canal.

advantage and the concentrates would be of better value; but to use the quantity of fluid necessary to pass the ore over concentrators would be reversing what would be easy and natural; for the ore would have to be impounded as tailings and the surplus water removed before cyanidation or chlorination could take place. As a consequence, the ore is leached first, and then, as extra fluid is necessary to carry the residues out of the mill, concentration

Reduction Co.'s mill at Gillette eleven, and at the Colorado-Philadelphia Reduction Co.'s mill at Colorado City twenty-one—all saving concentrates from the tailings of mills treating ores by chlorination. The concentrates obtained, as in the case of concentrates following leaching by cyanide, range in value from \$40 to \$140 to the ton.

One familiar with Cripple Creek ores and their treatment must acknowledge that admirable work is being done there by both cyanide and chlorination mills. Their success is an instance of intelligent adaptation of processes to the material in hand, and is due, not to theorizing as to what should be or should not be, but to meeting a situation as it is found to exist. And in at least one respect that situation is a very peculiar one. The ores treated, especially those which are locally known as the blue or unoxidized ores, have no free gold in them, and the sulphides are very fine and disseminated throughout the ore. Complete failure would necessarily follow attempts to amalgamate or concentrate such material. It would seem to be an ideal one for liquid processes, and yet must needs be roasted before it will surrender its values. The peculiarity is that particles of free gold of appreciable size, and which can be saved by chlorination, are found in the tailings. If you interrogate the mill men as to the object of concentration, their reply will be practically that of R. B. Turner (MINING AND SCIENTIFIC PRESS, May 21, 1898): "The idea of concentration is to recover the coarse gold which has not had time to be affected by the cyanide, and also any sulphides carrying values." The presence of coarse gold in the concentrates is universally recognized, and that it was not in the material when crushed will, I presume, be conceded by anyone at all acquainted with the ores in question. Theoretically, it would not be possible for coarse gold to be found in the tailings, but it is there, and recognition of the fact is money in many a man's pocket. In one sense of the word, it is enough to know that it is there and can be saved. The practical mill man may be satisfied with that knowledge, but the investigator will be interested in delving deeper. How did it get there? Where does it come from? I have my own ideas on the subject, based on a large number of laboratory experiments with a different class of ore, and may give expression to them in another article. In the meantime I will, and (I think) cyanidists generally will, be interested in any explanation of the phenomenon offered.

An Injunction Granted.

In the United States Circuit Court of the district of New Jersey, Aug. 30th, '98, Judge Kirkpatrick granted an injunction against the Whitaker Cement Co. as users of the Griffin mill, which is declared to be an infringement upon the Huntington mill, patented by F. A. Huntington, May 8th, '83. Judge Kirkpatrick discusses the subject in detail. He says:

Apparatus, appliances for crushing and pulverizing ores were known to the art at the time Huntington obtained his patent, as was also the mighty power of centrifugal force. Machines had been constructed to utilize this force for such purpose, but in every case the balls or rollers or crushers had rested upon the floor of the pan, so that when rotated at high speed the constant rubbing between the rollers and the pan and between the crushers and the driving arm induced excessive wear and tear and resulted in the rapid and continual destruction of the parts. Various means had been used in the attempt to overcome these serious objections. In the Pickering & St. John patent No. 71,055 the weights had been made round, and in the Lucop patent No. 173,411 the round weights were made to rotate upon their own axes, while in the Howland patent No. 263,497 the floor of the pan rotated, and in consequence there was present not only abrasive friction of the rolls upon the floor, but also against each other and the vertical part of the die. In all of these inventions there was present the circular annular die, against which the rolls or crushers were pressed or rotated. An examination of the prior state of the art discloses the fact that of the parts forming the Huntington combination the circular pan with its interior vertical die was old, the rollers rotating upon their own axes were old, as were also the shafts (or their equivalents) for propelling the rollers around the pan, but in none of the previous devices had there been a suspension of the rollers so as to allow them to move radially to and from the center, and rotate against the die by centrifugal force. This Huntington conceives and declares to be the important feature of his invention. By this appliance the rollers when rapidly rotated "were thrown outwardly by centrifugal force so as to crush anything between them and the die surrounding the inside of the pan," and by this means was overcome the abrasive friction of the rolls against the bottom of the pan and the driving arms, besides the maximum reduction of the excessive wear and tear that had been previously borne by these parts. It is impossible to read the record in this case and not be convinced that the suspension of the rollers so as to allow them to swing to and rotate against the rim of the inside die was the gist of the Huntington invention. It was not material how the rollers should be suspended—"the vertical carrying shafts may be

suspended in many ways," the inventor says—nor what other movements the rollers had; the important feature was that whatever peculiar manner of suspension was used it should be such as would allow them to move to and from the center, and be free to rotate against the die by centrifugal force. This was the application of a new principle to the art, to accomplish a result long sought, but until then never satisfactorily attained. Huntington did not devise a new way to do an old thing, but he made it possible to utilize a force long known but practically of as little value for the purpose to which he applied it as if it did not exist. I am of the opinion that Claim 1 of the patent is valid and not anticipated by any of the prior devices which have been cited to the court as having been used in the prior art.

In the specification describing his invention the patentee uses the following language: "My invention consists of a pan having an interior circular die around its periphery, and in combination with this of a series of rollers which roll against the die being suspended by vertical shafts turning in sleeves which have horizontal journals above, so that the rollers may swing radially. The suspending mechanism is suspended upon a cross or frame which is driven by a central shaft, and the rollers are thus thrown outward against the die by centrifugal action." Reference is also made to the drawings for a more complete explanation of the invention. These show an embodiment of the inventor's specifications, and on them a plurality of rollers and shafts appears. It is contended on the part of the defendants that by the use of the plural of "rollers" and "shafts" in the claim, and by the expression "series of rollers" in the specification, that Huntington has so limited his invention that the machine used by the defendants, which is constructed with a single roll suspended by a single shaft, does not come within its scope. In this view I cannot concur. I have little doubt that Huntington was impressed with the idea that the embodiment of his patent as shown in the drawing possessed advantages superior to any other, and that for certain reasons two rollers were more desirable than a larger series or a less number, but I am unable to conclude that he intended to limit the application of the principle he evolved to any particular number of rollers. He says: "In the present case I have shown two rollers suspended from opposite arms of the frame," but he does not thereby limit himself to two rollers. It may be properly inferred from his language that either a greater or less number would equally serve the purpose. "It will be manifest that the vertical shafts carrying the rollers may be suspended in various ways so as to allow the rollers to move to and from the center, which is the important feature of my invention." That is to say, my invention consists, not in the number of rollers or shafts, but in so suspending them, whether few or many, that they can be free to rotate against the periphery of the circular die, and, by centrifugal force, to crush against the die the ore or other hard substance intended to be pulverized.

free to swing to and from the center of the pan and rotate against the die was the novelty and the essence of the invention, and it was in this respect, as the defendants' expert declares, that the Huntington machine differed from the earlier mills of its class. This it was that gave the machine its undoubted excellence. In view of the prior state of the art, I find that the actual invention of the patentee was that by a combination of the means set out in Claim 1 of the patent a machine was constructed which for the first time embodied this important principle of construction. Neither the "rollers" nor the "shafts" constituted the novelty of the invention, and in this respect they differed from the "Springs S S" set out in the McLain patent, which was considered in the case of McLain vs. Ortmyer, 141 U. S., 491. In the present case no function is assigned to the plurality of rollers. The use of the plural included the singular, if the singular could do the work marked out by the plural.

While the rollers and shafts are mentioned in the plural, they are referred to in the claim by a "single" letter, so that as to them the claim is "fairly susceptible of two constructions. That one will be adopted which will preserve to the patentee his actual invention."

The duty of the court is to so construe claims that, without doing violence to the language used, to give the patentee what he has actually invented. In other words, "to make the claim commensurate with the invention."

After a careful consideration of Claim 1 and the specifications of the patent No. 277,134, I fail to find any intention on the part of the patentee to impose upon himself any limitation as to the number of rollers or shafts to be used in his machine. It is the first embodiment of the important principle of suspension by the combination of devices described in the claim, and any subsequent combination of the same devices embodying the same principle to accomplish the same result must be regarded as an infringement.

It will be useless to discuss the minor differences in the form and structure of the machine of the complainants and defendants. I have considered all of them to which my attention has been directed by the brief and argument of counsel. I am satisfied that the defendants' machine incorporates in its structure and operation the substance of the invention as set out in Claim 1 of the patent in suit, and is therefore an infringement thereon.

The complainants are entitled to protection against those who, availing themselves of the discovery, seek to justify themselves by pointing to mere form in the mechanical devices used. The complainants are entitled to a decree as prayed for in their bill.

Supposed to Be 300 Years Old.

The accompanying illustration represents the oldest house in Santa Fe, New Mexico, and presumably the oldest structure in the United States. Its exact

PROBABLY THE OLDEST STRUCTURE IN THE UNITED STATES.

The combination of the patent was not pan and rollers and shafts alone, but added thereto the means of suspending said shafts from above, so that the said rollers might rotate against the die by centrifugal force. The suspension of the rollers so as to be

age is not positively known, but the general belief is that it is at least 300 years old. The building is situated in the immediate vicinity of San Miguel church, which is locally credited with being three centuries old.

Recent Mining and Metallurgical Patents.

616,311. CRUSHING-MILL STAMP-STEM. CHARLES GRACEY, Kingman, Ariz. Filed Apr. 1, 1898. Serial No. 676,042. (No model.)

Claim.—An improved stamp head and stem consisting of the stamp-head having a transverse drift-opening and an opening in the center of its upper end and covering downwardly, and a stem having a short tapered portion to closely fit the upper portion only of the central opening and having a portion below said tapered-portion of less diameter than the latter to maintain this prolonged portion out of contact with the remaining portion of the walls of the tapered opening in the stamp-head, the lower end of the said reduced portion extending into the drift-opening whereby it may be engaged to detach the stem from the head.

616,391. PROCESS OF OBTAINING SULFUR FROM SULFATES. VLADIMIR DE BARANOFF and EUGENE HILDT, Paris, France. Filed June 22, 1896. Serial No. 596,524. (No specimens.)

Claim.—1. The herein described process of extracting sulfur simultaneously with sulfids and sulfurous acid from metallic sulfates by treating a metallic sulfate with sulfureted hydrogen under heat and thereby decomposing the sulfate into sulfur, sulfurous acid and sulfids, substantially as described.

2. The herein described process of extracting sulfur, simultaneously with sulfids and sulfurous acid from metallic sulfates by reducing a metallic sulfate by means of carbon under heat, causing the carbonic acid generated to act in presence of water upon a metallic sulfid to generate sulfureted hydrogen and then treating a metallic sulfate with the sulfureted hydrogen under heat and thereby decomposing the sulfate into sulfur, sulfurous acid and sulfids, substantially as described.

Industrial Notes.

—The S. P. Co. is reported ready to begin building a line of railroad from San Diego, Cal., to Yuma.

—The United States has decided to place the entire Philippine archipelago under American jurisdiction.

—A new track is to be built for the Sierra, Cal., railway, and the line extended to Sonora and Summersville.

—The White Pass and Yukon Express Co. is the latest incorporation in connection with the first railroad in Alaska.

—The coal output of the State of Washington this year is 1,715,515 tons, an increase of nearly half a million over 1897.

—For the fish industry of Puget sound Japan is a new customer. Fourteen hundred tons of salt fish were shipped from the North Pacific coast to Japan last year.

—Preliminary contracts have been made between the Kiushiu and Sanyo, Japan, railway companies and the Yokohama agents of Peacock & Co. of London, for loans amounting to \$7,500,000.

—Beginning to-morrow all Eastern mail will arrive at Pacific coast points thirteen hours sooner than before. Under the new system San Francisco and New York City are distant 100 hours by mail.

—Before the end of January the Hawaiian Islands will become a strong base of naval strength, and, in conjunction with the effective forces at Manila and San Francisco, will effectually command the entire Pacific ocean.

—The Globe, Arizona, Times notes that the mining companies have nearly exhausted the timber in the Pinal mountains, and that in a short time a railroad will have to be built north to the pine forests, or timber must be shipped from California.

—President Jefferey of the Denver & Rio Grande R. R. Co., says: "In the seven years that I have lived in Colorado, I have never seen such evidences of general prosperity as we now have. This applies to all kinds of business, trade, agriculture, and, best of all,

the mining interests, which form the basis of Colorado's prosperity. The mining camps at Cripple Creek, Leadville, Aspen, Creede and other points are making a larger output of ore than they have in many years.

—Senator Hoar of Massachusetts says the Nicaragua canal should be built at once for the protection of the Pacific coast and for the commercial relations between our Western and Eastern ocean borders, and that it should be built by the Government.

—The establishment of a steel foundry in Chihuahua, in the northern part of Mexico, by Henry Creel and his associates marks a new era in Mexico's industrial progress, as up to the present time over 12,000,000 of people have depended for their supply of iron and steel almost exclusively on foreign countries.

—The San Francisco Mechanics' Institute plans to hold a Colonial Fair at the Mechanics' pavilion, beginning September, 1899, to continue three months, to be confined to the exhibition of the resources of the Philippines, Cuba and Central America, and Congress will be asked for money to cover the appointment of a special commission to visit the regions mentioned and make collections of exhibits.

—The Los Angeles, Cal., Oil Producers' Trustees report that in November receipts were 10,685 barrels; sold during the month, 17,260 barrels; balance in storage December 1, 71,865 barrels; gross amount received for the 17,260 barrels sold, \$14,876.61, an average of 86.19 cents per barrel at the wells. What is reported to be the finest grade of light oil yet pumped in southern California is said to have been discovered in the wells of the Columbia Co. near Fullerton in Orange county.

—One restaurant during the past winter at Dawson, N. W. T., had the following bill of fare tacked on the wall: Bowl of soup \$1, mush and milk \$1.25, canned corn \$1.25, stewed fruits \$1.25, canned tomatoes \$3, slice of pie 75 cents, coffee or tea \$1, with pie or sandwich \$1.25, beans, coffee and bread \$3, plain steak \$2.50, porterhouse steak \$5, hot cakes and maple syrup \$1, poached eggs on toast \$2. A leading restaurant, having a seating capacity of thirty-two, employed three cooks, one of whom received \$100 a week and the others \$1

616,427. ROCK-CRUSHER. BAGSTER R. SEABROOK, Victoria, Canada. Filed Dec. 29, 1897. Serial No. 664,315. (No model.)

Claim.—1. In a rock crusher and pulverizer, a curved bed supported in a suitable frame, in combination with an oscillator; bearing-blocks vertically adjustable in suitable guideways in the frame of the machine and having the shaft of the oscillator journaled therein; a toothed upper curved bed communicating with the lower bed and having a toothed oscillator adjustably journaled therein; an arm extending from each oscillator; a link connecting the said arms, one or more eccentric-rods journaled to the arm of the oscillator, and eccentrics operating said rods; and a shaft for transmitting power to said eccentrics, substantially as described.

2. In a rock crusher and pulverizer, a curved bed supported in a suitable frame, in combination with an oscillator normally in contact with the lower portion of the bed, bearing-blocks vertically movable in suitable guideways in the frame of the machine and having the shaft of the oscillator journaled therein; and means tending to retain the oscillator in contact with the bed; a toothed upper curved bed communicating with the lower bed; a toothed oscillator journaled in proximity thereto; an arm extending from each oscillator; a link connecting the said arms and means for rocking one of the oscillators, substantially as and for the purpose specified.

3. In a rock crusher and pulverizer, a curved bed supported in a suitable frame, in combination with an oscillator normally in contact with the lower portion of the bed; bearing-blocks vertically movable in suitable guideways in the frame of the machine and having the shaft of the oscillator journaled therein; means tending to retain the oscillator in contact with the bed; a toothed upper curved bed communicating with the lower bed; a toothed oscillator journaled in proximity thereto; an arm extending from each oscillator; a link connecting the said arms and means for rocking one of the oscillators, substantially as and for the purpose specified.

616,273. MINER'S DRILL. JOEL F. STRAUSSER and HARRY T. KLINGER, Tower City, Pa. Filed May 12, 1898. Serial No. 680,528. (No model.)

Claim.—As an improved article, a miner's drill consisting of the body portion, the downwardly-extending central portion formed with four vertical wedge-shaped or beveled cutters at right angles to each other, and the inner ends meeting at a common point, and the outwardly-inclined tapering or wedge-shaped side cutters, located above and in the same vertical plane with said central cutters, but having their cutting edges at a right angle thereto, substantially as described.

an hour. Four waiters are paid \$50 a week each, and the women \$100 a month. The leading gambling house and dance hall employs three bartenders, two waiters, a bookkeeper and porter. The barkeepers receive \$15 a day, the bookkeeper \$17.50, waiters \$15 and porter \$10.

—If the Canadian Commissioners have succeeded in securing free admission of Canadian coal to American ports, it will hurt the State of Washington in benefiting other parts of the coast. The coal industry in that State amounts to \$12,000,000 per annum. The Pacific Coast Co.'s mines produce 40,000 tons a month. Under free production Washington cannot compete with British Columbia mines. Few Washington miners make less than \$3 a day; Chinese make 65 cents. British Columbia mines are on salt water and can load 80 per cent cheaper than Washington can.

—Early in '99 it is expected that between San Bernardino and Los Angeles, Cal., the Southern California Power Co. will begin the distribution of electricity to every part of the country between those two cities. The plant is about completed at a cost of \$800,000. Preliminary work began in November, 1898. Since May, 1897, men have been at work in the Santa Ana canyon digging ditches and tunnels and building flumes which carry the water from the intake to the power-house. At the junction of Bear creek with the Santa Ana river to the head of the pressure a conduit has been constructed three miles. Of this distance 11,555 feet consists of eighteen tunnels, 2682 feet of flumes, 167 feet of open canal, 680 feet of head flume, 132 feet of sand boxes and sixty-two feet of reservoir and forebays. The first tunnel is through solid granite; the others are all cemented. From the mouth of tunnel No. 18 the water is dropped almost perpendicularly for 728 feet to the power-house through 30-inch pipe. The water is thrown into the buckets of the turbine wheel from a nozzle 4 1/2 inches in diameter, the power in the stream being 300 pounds to the square inch. With the machinery used this is enough power to generate 1250 H. P. The four dynamos will be driven 300 revolutions per minute. The dynamos rest upon their own foundation and receive water from their own nozzles,

and they are so arranged that there are really two complete systems. The electric current is to be conducted to Los Angeles, over eighty miles. It is intended to deliver there 4000 H. P. with a loss of only 10 per cent.

Personal.

M. J. BURNS is Supt. Eureka mine, Republic, Wash.

W. D. McDUGALL has returned to California from South Africa.

F. B. HILL, Supt. Oriental mine, Alleghany, Cal., is in San Francisco.

W. H. STORMS, Supt. Agnes mine, Sonora, Cal., is in San Francisco.

C. C. COTTON has been appointed Supt. Edison mine, Red river, New Mexico.

W. LEANUE has been appointed Gen. Mgr. Blue Grouse M. Co., Moscow, Idaho.

JAS. CRONAN of Hackberry, Arizona, is in San Francisco to buy some concentrators.

R. FLINTERMAN succeeds A. Mackay as Supt. Kildona mine, Pluma, South Dakota.

M. W. MATHER, Supt. Plumbago mine, Alleghany, Cal., has returned from San Francisco.

JNO. W. MACKAY sent \$500 on Christmas to the poor of Virginia City and Gold Hill, Nevada.

L. T. WRIGHT, Gen. Mgr. Mountain Copper Co., Keswick, Cal., has returned from San Francisco.

G. W. STARR, succeeds to the position of Gen. Mgr. of the Omaha Con. mines at Grass Valley, Cal.

JNO. O. BOUSE, chief engineer Twin Placer, Idaho, M. Co., is in San Francisco, to get machinery and competent hydraulic miners.

F. ZEITLER, Pres. St. Gothard Con. mine, North Columbia, Cal., and Supt. Champion mine, Nevada City, Cal., is in San Francisco.

CHAS. BUTTERS, Berkeley, Cal., is visiting La Colorado and Minas Prietas, Sonora, Mexico, and exporting the ore tailings of those localities.

G. HUESER of Cologne, Germany, a Government mine inspector, is examining copper properties in Shasta county, Cal., for Dusseldorf and Cologne capitalists.

D. KIETH, managing owner Silver King and Gen. Mgr. Valeo mines at Park City, Utah, has reached home from Sonora, Mexico, where he has been examining mining properties with a view to purchase.

C. J. FULTON, who retires from the management of the Gold Nugget M. Co. at Clancy, Montana, to take charge of an Eastern company's interests in developing Montana and Colorado mining properties, will be succeeded by W. A. Miller, Jr., of New Jersey.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

20,821.—DESIGN TWINE CUTTER—J. Joffraud, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CRUSHING MILL STAMP STEM.—Charles Gracey, Kingman, Ariz. No. 616,311. Dated Dec. 20, 1898. This invention is designed to prevent the breakage of stamp stems at their junction with the heads into which they are fixed. The stem is usually tapered at the lower end and fits into a correspondingly shaped socket in the stamp head. The constant dropping of the stamps produces twisting and bending strains which eventually crystallize and weaken the stems so that it breaks off at the junction with the head. In this invention the taper of the stamp stem is made to fit the upper part of the chamber in the head for a distance not greater than the diameter of the stamp stem, and the lower part is made something smaller so that it does not quite fit the bottom of the opening. This allows a slight movement either one way or the other when any sudden wrench or side pressure is brought upon the upper part of the stamp head, and this yielding prevents the shock and strain upon the stem which would eventually break it.

Mining Summary.

ALASKA.

Ex-Gov. Swineford of Alaska and Chicago men have a bond on the Merrimac and Monitor claims, Sumdum district. The two ledges run parallel with each other. A tunnel was run in on the line between the two claims and a body of quartz 15 feet wide was encountered. The first 10 feet assayed an average of \$8.60 to the ton, the last 5 feet \$15.35, and the whole 15 feet \$11.35. The company will erect a 10-stamp mill on the property.

ARIZONA.

J. Hanna has eighteen men at work on his Gopher mine near Prescott and is taking out shipping ore.—B. Collins has several carloads of copper ore on the Blackfoot mine awaiting transportation to Kingman.—The Columbia smelter will renew operations soon after Jan 1st. Considerable ore in the Harshaw and Washington districts awaits smelting.—Strahan & Son near Jerome struck a ledge 3½ feet wide that assays well in copper and gold.—A new shaft is being sunk on the Vulture mine near Prescott.—Crowe & Montrose are making a success in working the Bedrock mine under lease. The mine is in Peeples valley; the ore is worked in the Yarnell mill. Several bars of gold bullion were recently obtained from a cleanup.—Near Wickenburg the Butte & Boston Co. is working extensively on the Hamlyn properties and at the King Solomon group they are sinking several 100-foot shafts. Denver people are working the McIntosh properties with success and it is locally stated that some mills will be put in there soon.

The Red Cloud mine, near Yuma, has been leased by H. P. Griswold. This mine is developed by several shafts. Ore is being taken from the third level, where the vein averages 8 feet and carries about 50 per cent lead and ninety ounces of silver.

A streak 18 inches in width of fair grade ore has been struck on the Wedge mine, in Lost Gulch, Gila county.—On the divide between Mineral and Pinto creeks, Burns & Co. are taking copper ore from one of their claims. That averaging 45 per cent is shipped to the smelter.—The Great Republic group of five copper claims, in Pinto district, are developed by a 230-foot tunnel on one, an 80-foot tunnel on the other, and the properties are showing well.

Miller & Wentworth, on Gun creek, are taking out ores that average 12 per cent copper, \$5 in gold and \$6 in silver to the ton.—A smelting plant has been installed by the Spetzuma M. Co., operating near Geronimo. Three 50 H. P. boilers are among the equipments.—A narrow gauge railroad, seventy-one miles in length, connects the copper mines of the Arizona Copper Co., at Clifton, with Lordsburg, New Mexico. The Longfellow, Metcalf, Coronado and Queen mines are connected with the railroad by 20-inch tracks. It is stated that the cost of reducing the ores of these mines has been minimized until ore carrying 3 per cent copper may be profitably worked.

The electrical process experimented with at the Vekol silver mine, in Maricopa county, has been abandoned and new machinery erected.—Los Angeles people have bonded the Patterson group of mines, in Mohave county, and work on them will begin soon.—In the Katie mine, at Mineral Park, at a depth of 160 feet, ore is extracted that runs 700 ounces in silver.—The Yellow Ned mine, in El Dorado canyon, has an ore body 3½ feet in width. Ore sold to the sampling works carried 9 ounces gold and 146 ounces silver a ton.

In Pima county rock running 200 ounces in silver and \$20 a ton in gold, is being taken out of the Blue Jay mine.—A ledge recently discovered in the Baboquivari mountains by W. J. Clark, is large and assays 16 per cent copper and \$4 in gold.—The mines of Oliver Camp are producing high-grade silver ore.—The shaft of the Victoria mine has been sunk 145 feet, and the ore being taken out is good-grade gold and silver.—The Mineral Hill or Asurite mines, near Tucson, shipped in past years, under lease, some 5,000,000 pounds of copper, gold and silver-bearing ores, averaging 15 per cent copper and reasonably rich in the other metals. The ore body is said to be 200 feet wide. The property is being worked under the supervision of T. C. Hughes.—In Graham county the Detroit Copper Co., at Morenci, is making extensive improvements. Work has begun on a 400-ton concentrator.—Thirty men are now employed on the Ray copper mine, Pinal county, which is being developed under bond. A diamond drill will be put in once.

Globe Times: At Globe the United Globe Copper Co. is running a 200-ton furnace, doing custom work for the Black Warrior mine, the management of which hauls ore by wagon from Webster Gulch, twelve miles. There are 250 men employed at the United Globe. Among the prospective improvements is electricity, by which the slag cars will be propelled. The United Globe is enabled to ship two ways at a reduced rate below that of ten months ago. The pay of miners is \$3 a day.—At the Old Dominion Copper Co.'s smelter for sixteen months no work was done, while for two months past there has been turned out enough bullion to load a train of thirty cars. The furnaces dispose of 150 tons of ore daily. A depth of 800 feet has been reached and the mine workings are extensive. About 300 men are employed.—The gold mines at Mesquite are being successfully operated.—The Helvetia in the Santa Rita's shipped 125 sacks of high-grade copper ore to Silver City.—The Temple Bar Placer Co. of Kingman owns 1000 acres of gravel which is from 50 to 300 feet deep. The company has a large pumping plant in operation. A month's run yielded \$60,000.—A 40-stamp mill is running at White Hills and producing considerable silver bullion.—Reports received from the Grand

Reef mine show an increase of good ore. The ledge has been penetrated to a depth of 467 feet and a tunnel is being driven to strike the 400-foot level. Both drifting and sinking continue.

Yuma Sun: In Picacho district, at Venus, H. W. Blaisdell is operating the old Janes property; about seventy-five men are employed and satisfactory results are secured. The mine is a low-grade property, the average of ore yielding from \$4 to \$5 per ton under the cyanide treatment, but ore of higher grade is found running \$15 per ton.—S. W. Dorsey is doing the assessment work on his group of claims, giving employment to a number of men.—The Tarantula group is being developed.—Brown & Werninger have twelve men at work on the Paymaster group of silver and lead claims, and ore is being shipped.—H. P. Griswold, who is operating the Red Cloud mine, has seventy-five tons of high-grade silver-lead ore on the dump.—A. O. Brodie is placing a 20-stamp mill, a hoist of 2000 feet capacity and a pump on his Crown Point mine in Yavapai county. The pumping plant will be placed on the Hassayampa, two miles from the mine.—A. Heller is developing a property at Prescott, with good results. The ledge is 5 feet wide.

Yuma Sun: Under the operations of the newly formed Potholes M. & M. Co., the old Potholes mine near Picacho is proving a money-maker. The battery of four 2-stamp triple-discharge mills is at work on the low-grade ore which is abundant in the mine, about forty tons going through the mill every twenty-four hours. The ores will average about \$4 per ton and is worked at a good profit. Two cleanups have been made both of which proved satisfactory. The shaft has reached 250 feet.

Phoenix Republican: H. J. Sisty at Yarnell is running ten stamps of the 20-stamp mill on ore from the Bedrock mine at Peeples' valley. The Bedrock is not a new mine, although its development has just begun. It was worked years ago. The product is hauled six miles to the mill and gives a profit. Several gold bars were shipped last week. One of the small bars contained forty-eight ounces.—At Vulture the New Vulture is sinking a new shaft.

CALIFORNIA.

Amador.

At the Baldi mine, Sutter Creek, the foundation is ready for the new air compressor. Supt. Porter will put on a full crew Jan. 1st and work will be pushed.

At the Jackson Butte mine, near Jackson, a bedrock tunnel is being driven 230 feet, 190 of which has been completed.—Work at the new shaft of the Kennedy mine is progressing, and it is expected that the engines and hoist will be ready for operating Jan. 15th.

Butte.

The Oroville Register says that two dredgers are to be built during the winter, near Oroville—one on the P. K. Welch place and the other on the Mortenson land.—The Sanders gravel mine, near Chico, which has been idle for some time, was recently sold to McCongar & Co., who will at once begin work.

The Register says there are few persons who know the large sums of gold taken from the mines of Butte. The miners themselves are always adverse to stating any facts concerning their mines and the reasons are obvious that we need hardly refer to them. One is the danger of robbery if it is known that their mines are paying well. Some instances of the past showing the sums in gold extracted may not be amiss. During the month of November, 1897, one mine took out a trifling \$69,000. During the month of December of that year the same mine took out \$47,530.

Calaveras.

A force has been put at work at the Hexter mine, near Mokelumne Hill, retimbering the tunnel and doing other preparatory work.

The Calaveras Chronicle says rich gravel has recently been struck in the Lamson claim, near Railroad Flat.

San Andreas Citizen: At Vallecito the Sanguinetti mine has started up again. Pumping machinery has been installed and sinking resumed.—The Lundberg hydraulic mine has resumed operations. O. Sloan is running a 400-foot tunnel to tap the gravel deposit. The work is rushed night and day.—At Angels Camp the rain last week enabled the Utica, Stickle and Lightner mills to resume operations.—At the Thorpe mine operations will be resumed as soon as the new machinery is in place.—Supt. Blackhart of the Harr's mine will have a new hoist installed at the Harris mine and sink a shaft 400 feet.—In the Gardner mine, near Telegraph City, the shaft is 110 feet deep and the vein is from 3 to 5 feet in width, which is good grade.

San Andreas Prospect: The Oriole M. Co. will begin work on one of its properties, the Big Bonanza, near Angels Camp, and a hoist of sufficient power will be erected to sink 1000 feet. Bids for a 45-H. P. boiler and a 35-H. P. engine will be accepted; the timbers for a 45-foot galloways-frame have been ordered. In the meantime sinking the shaft, which has reached a depth of 250 feet, will continue.

El Dorado.

Placerville Nugget: At the Oro Fino mine, near Shingle Springs, operations have been resumed in consequence of the recent rains, and fifty men are at work. The 30-stamp mill is running night and day, and the fires were started last week at the chlorination works.—At the Vandalla, in the same district, ore is being hoisted from three levels; about forty tons per day are being crushed and afterwards treated by the cyanide process. Eighteen men are employed.—Hall & Baughman, owners of the old Fort Yuma mine, near Shingle Springs, have resumed development work.—The Boulder M. Co., on Weber creek, have enlarged their ditch and are running their 20-stamp mill night and day on high-grade ore. It is said that the company contemplate adding ten more stamps

to their mill soon.—Unwatering the Grand Victory mine near Placerville is being pushed. The 30-stamp mill will soon be in operation.

Georgetown Gazette: Davis & Farmer made a strike of good value last week in the Argonaut mine near Georgetown. The mine is owned by J. Smith of Greenwood.—As a result of the rain the Big Sandy, Rising Sun and Gopher-Boulder mines at Kelsey started up last week.—Slate is being shipped from the Strable quarry near Kelsey, on which work was recently resumed.—The El Dorado Con. M. Co., at Josephine, are making borings on their gravel property.—J. P. Cranmer is rushing work on the Golden Hope mine at Pilot Hill.

Placerville Democrat: At the Marguerite mine, in the Diamond district, sinking continues; the shaft is down 100 feet.—At Slate Mountain the ledge of the Independence mine, in which a strike was made recently, is 20 inches wide, and said to be of high grade. The owners, Schiff & Limpensel of Placerville, contemplate the erection of a mill on the property soon.

Kern.

The Ruby and Alpha claims near Johannesburg are shipping good milling ore.

The framework of the Yellow Aster Co.'s new mill building is completed. The company's well and pumps are in good working order. The capacity of the wells has been definitely determined to be not less than 100,000 gallons in twenty-four hours, more than enough to keep the thirty stamps in operation. The success of the Yellow Aster Co. in increasing by sinking and tunneling, their water supply from a few thousand gallons to 100,000 gallons per day, has encouraged others who own "water land" in the same range of hills to prospect for water and it is probable that new wells will be sunk.—The new mill on the Hard Cash started up this week.—The Johannesburg L. & W. Co. is pumping from 25,000 to 30,000 gallons of water a day.

Randsburg Miner: The Wedge mine near Randsburg shipped seventy tons of ore to the Johannesburg mill for two weeks and as much more will follow before Jan. 1st. This is mostly low grade ore running \$25 a ton.—On the O. K. the shaft is down 75 feet and is in good ore.—The Black Hawk, owned by Wilson & Co., has twelve shafts sunk, ranging in depth from 10 to 100 feet. Some rich ore has been milled from this mine but it is generally regarded as a low-grade property, running from \$20 a ton down. The last eighty tons milled \$15 a ton. The mill being built will be in operation Feb. 1st.

Los Angeles.

The Victoria mine in the Seritas district is in good ore and also in a prosperous condition.

Mono.

The Bridgeport Chronicle says that the late storms have deposited a large quantity of snow on the mountains and that the placer miners next summer will have a larger output of gold from Mono county than they have had for many years.

Bridgeport Union: There are two mining properties in the new district in Little Antelope valley. J. E. Carter took up placer claims in the old Silver King district in Alpine county, but a portion of the placer ground is in Mono. An Eastern company has become interested in one through J. E. Carter of Antelope valley. Next spring there will be much work done in running tunnels.

Nevada.

At Washington J. McCarty has bonded his group of quartz properties to capitalists from the East. The company is represented by G. W. Hall, Supt. of the Eagle Bird mine at Maybert. The properties have considerable development work done. The ledge is large but low grade. It is locally reported that Supt. Hall contemplates building a 50-stamp mill without delay.

Grass Valley Union: The control of the Omaha, Lone Jack and Homeward Bound mines, near Grass Valley, has been bought by W. B. Bourn, Pres. Original Empire M. & M. Co. These mines cover nearly 4000 feet of vein and a surface area of about sixty acres. The pumping and hoisting machinery is capable of working the Omaha mine to a depth of 2000 feet. The mines have paid \$150,000 in dividends. The Omaha is down to the 1500 level, and the Lone Jack has been sunk to the 1700. Drifts have been run over five miles in length. The Homeward Bound is connected with the two former mines. There are said to be three pay shoots, the vein varying in thickness from 6 inches to 3 feet, yielding on an average \$25 to the ton. It is locally reported the mines will be worked on a large scale.

Placer.

During November the Pioneer mill crushed 556 tons ore; average value, \$11.89. The payroll for the month was \$3256; net earnings, \$2132.

Colfax Sentinel: Development work is in progress on quartz claims in Humbag canyon. The claims are owned by T. S. Hawkins of Hollister. The ledge is about 22 feet in width. A shipment of 2680 pounds of ore to Selby's returned \$61.70 in gold.—At the Hidden Treasure mine, as soon as the winter rains move the tailings, the mine will be run with an increased force. Supt. Power says that, even with a reduced force, they are able to take out 400 cars of gravel daily.—At the Bradshaw Bar gravel mine the owners have completed a five-mile ditch. Flumes are in place and work will begin as soon as sufficient water can be secured.—The new electric plant at Pioneer is in place. A trial made shows everything in working order, awaiting the rains.—At the Buckeye gravel mine, near Forest Hill, sixteen men are employed. J. A. Seward is Supt. The mine is owned by J. A. Johnston and Mrs. J. V. Collins.

Plumas.

C. Schneider is meeting with success in the development of his mine in Meadow Valley.

Riverside.

Tailings at the Good Hope mine continue being run through the cyanide process; but owing to the mineral existing, the yield of gold is not large.—Over \$1000 a month in gold is taken from the tailings at the Santa Rosa mine by the cyanide process.—The Riverside Gold Co. at Perris last week found a valuable pocket on the 200 level. The mill is running day and night. The mine employs twenty men.

Sacramento.

Work will begin soon on the dredging plant for mining Mississippi Bar, in the American river, near Folsom.

San Bernardino.

The shaft on the Rose mine, near Victor, is down 250 feet. A cyanide plant will soon be erected.

San Diego.

The Hubbard mine, near Ramona, has resumed work.—The new hoist for the Helvetia mine at Julian was put in place last week and the mine is in operation.—E. W. Sebben is developing his four claims—the Denver, Portland, Anaconda and Rico Aspen.—The assay on samples of vein float ore from claim No. 2 of the recently discovered Pearce sulphur mines, near Coyote Wells, shows a gold value of \$6 per ton, iron 28.45 per cent and sulphur 30.89 per cent.—At the Ranchita mines the 5-stamp mill is running night and day on \$30 ore. C. J. Coutts says he must have a 20-stamp mill to handle the Ranchita's large ore body that has been opened up.

San Diego Union: Although only a part of the stamps in the mill at Hedges were in operation during November, the Golden Cross mines produced \$38,000 in bullion, about half of which is net profit. The machinery will be in better shape this month, and the output is expected to be large. Between Hedges and Yuma, including the former camp, the monthly output of bullion amounts to about \$110,000.

Shasta.

Redding Free Press: Supt. Langdell of the Eureka Tellurium mine near Middle Creek, on which operations were recently resumed, has five men at work.—At Keswick the smelters closed down Dec. 20th and will remain closed until Jan. 5th, for the annual cleanup and the taking of stock. The matte furnace has started and it will take several months to run the deposit through. During the holiday shut down the crew on green ore will be kept at work.—Near Harrison Gulch a good strike was made on the Morgan & Booth claim.—At Copper City a strike was made in the Bully Hill mine of a ledge 26 feet in width of high-grade ore. Five four-horse teams are hauling ore from the mine to Redding to be shipped to the Selby smelter.

Shasta Courier: At Harrison Gulch about 150 men are employed. The new roaster is in course of completion. Capt. Roberts is also sinking a deep shaft on the White Oak properties at Lower Springs, near Shasta. He has also bought the Penrose claims in the same vicinity.—Klett & Blair are running a tunnel on their claim near Whiskeytown and have good indications.—J. C. Frick contemplates the extension of the tunnel in the Oro Fino claim near Shasta.—A. Hunting and partner are reported to have struck a body of high-grade ore in the property they recently bought near Shasta.—About forty men are employed at the Mt. Shasta and the mine is shipping ore to Keswick. It is locally reported that a mill will be erected there soon. O. O. Howard Jr. is Gen. Mgr.—The Spanish mine has seven men extracting ore. The stamps will begin to fall as soon as more rain comes.

Sierra.

(Special Correspondence).—Work is progressing on the old Oriental mine, near Alleghany, on which operations were recently resumed. The shaft has been unwatered and retimbered to 80 feet. It is 250 feet deep. Supt. F. B. Hill will thoroughly develop the property, and if it warrants he will erect a complete plant of machinery. Fifteen men are employed and work proceeds day and night. A pump is in operation with a capacity of 30,000 gallons an hour.

Alleghany, Dec. 23d, '98.

The Mountain mine at Sierra City resumed work last week, which had temporarily ceased on account of frost.

Downieville Enterprise: The Plumbago mine near Alleghany, under the management of M. W. Mather, is proving successful. He is having an electric light put in at the mine. A 10-stamp mill is steadily crushing the ore, which is good grade, and twenty-five men are employed. He contemplates operating the machinery by compressed air.

Downieville Messenger: A second air compressor was started up last week at the Gold Bluff mine, near Downieville; also an air receiver was installed in the mine. About thirty men are employed. Work will continue all winter.—The mill at the Triple mine in Slug canyon started up after the recent rain and will continue during the winter unless the frost becomes too severe.

Sliskiyou.

Yreka Journal: Work is progressing in reopening the old Golden Eagle mine at Indian Creek.—The Sheba Co., working the old Fry & Macauley mine at Patterson creek, have their new mill ready for crushing.—On Salmon river all the miners are prepared for operations in quartz and hydraulic claims, as soon as water is supplied.—At Oro Fino, the John Pitts mine is turning out good ore. The last crushing milled \$60 a ton. The lessees are pushing development work.—The Providence mine has been bonded to G. W. Oberholzer, who is running a tunnel.—E. B. Star is working the Gardner & Demming quartz mine with a steam hoist, and taking

out good ore.—J. and W. Chase are taking out ore and W. Eastlick is crushing ore on the Eastlick mine.—The Old Wright & Eastlick hydraulic mines, under the management of J. O. Rusby, have three Evans' elevators in position.—C. Shell has the Gardner & Shell mine in shape for work. He began piling some time ago but the recent cold snap froze up the ditches.—Macaulay, Fry & Oberholzer are doing development work on the Leader mine at Patterson creek.—It is locally reported that J. O. Rusby has bought the Dick Johnson quartz mine, mill and ditch in Oro Fino.

TRIOLITY.

The Mountain Boomer mine near New River, in which capitalists of San Francisco are interested, is an old property which was worked years ago, and supposed to have been worked out. The new company began where the old one quit and they are satisfied so far with their speculation. The old works have been reopened at a depth of 240 feet where a 30-inch ledge has been uncovered which runs \$40 a ton in gold. A second tunnel is being run which will be 650 feet below the old one. To convey supplies to the camp a pack team of sixty mules is employed to take them seventy-five miles from Red Bluff.—The Postlethwaite dredger operated at Poker Bar is working and returns are satisfactory. The dredger is run night and day. It has a capacity of 2400 cubic yards a day of twenty-four hours.

In the Brown Bear mine at Deadwood the compressor plant was started last week. Work will be pushed on the 4000-foot tunnel, which is in 200 feet.

TUOLUMNE.

Sonora Independent: Work on the Possible mine at Columbia is progressing. The vein was struck last week, which is $3\frac{1}{2}$ feet wide and prospects well.—At the Pug-of-War mine at Five Mile Point the tunnel is being pushed. Forty feet from the mouth a shaft is also being sunk.—H. Nelson is opening a hydraulic mine in Spring Gulch.

COLORADO.

BOULDER COUNTY.

The shipment of ores to the Culbertson mill near Boulder continues from points accessible to the line of the Colorado & Northwestern railway, and satisfactory results have been obtained from concentration. Ores as low as \$6 a ton have yielded a profit, owing to the liberal arrangements made on transportation and dressing charges by railroad and mill management.—The big dumps of the Dew Drop and Adit tunnel are being shipped since the construction of switches to those points have made an economical handling of the ore possible.

Denver Mining Record: Pres. W. P. Daniels of the Adit Dew Drop mines at Camp Frances has awarded a contract for the first 50 feet of work on the Sunset-Frances-Ward tunnel. This begins one of the great tunnel enterprises in Colorado. The plans of the company that will push this scheme contemplate a bore 8x8 feet in the clear. It will cut the Adit Dew Drop vein at Camp Frances at a depth of 1750 feet and the Columbus vein at Ward at 2000 feet. A plant will be put up at the mouth of the tunnel at Sunset at once and work will be pushed. The promoters have located twenty-one claims between Sunset and Frances, nearly all of which parallel the big bore.

CHAFFEE COUNTY.

At Whitehorn another 8-foot vein has been uncovered on the Esther. In 18 inches of the vein copper is visible. Tests on the entire vein give an average of 40 to 60 per cent copper and \$17 in gold per ton.—The fourth 12-ton shipment under the new management was made last week from the Independence. Assay tests range from \$15 to \$200 in gold to the ton.

CLEAR CREEK COUNTY.

The Aliende Con. M. Co., near Georgetown, have struck a vein in the 850-foot level of the Colorado Central workings.—The Griffith mine shipped 100 tons of ore last week. The mine gives employment to fifty men.

EAGLE COUNTY.

Shipments of ore from the Battle Mountain district last week were thirteen carloads, a total since Jan. 1st of 404 carloads.

EL PASO COUNTY.

The Keith & Grube lease on the Vindicator at Victor is outputting from thirty to forty tons daily.—The Modoc maintains its output at thirty tons a day, the ore running from \$35 to \$100 a ton.—The Victor mine has found a large body of medium grade ore at the eighth level. The production, which had fallen off to eighty tons in the past month, has again been increased to 100 tons per day.

Victor Record: Near Victor the Creston Leasing Co., operating on the Jack Pot, at a depth of 250 feet, has an ore chute that has been drifted on for 300 feet, 4 feet wide, 18 inches of which will probably average \$250 to \$300 a ton. A shipment of nearly thirty tons of this grade was sent out last week; the shipment should bring close to \$7000. The lease is employing ninety men, and shipments are running forty tons a day. The new shaft will be completed about Jan. 8th, when the force will be increased and the output possibly doubled. The drift is lighted by electricity, and an electric hoist is installed over a winze.—A shipment from the Abe Lincoln mine last week consisted of between sixty and seventy tons of coarse rock and screenings, the value of which is unknown. Former shipments, however, have averaged \$50 a ton.—The ore is from a depth of 350 feet. The pump is raising about eighty gallons of water a minute.—The Lafayette mine, which has been worked under bond for several months, has been sold to the Princess Alice G. M. Co., composed of Eastern ladies, for \$28,000. An electric hoist is being put in to replace steam power. An ore chute was recently opened in

the 575-foot level and a heavy shipment was marketed last week.

GILPIN COUNTY.

Three tons of uranium ore were shipped recently from the Wood mine at Central City. Some of the ore from this property has been sold for over \$1 per pound.—The force of the Flske mine is sixty men and the daily shipment of ore is fifty tons. The shaft is over 1000 feet deep.—The Rocky Mountain concentrator at Black Hawk is running day and night. Last month it treated nearly 1500 tons of ore, which yielded 500 tons of concentrates.

GUNNISON COUNTY.

The Taylor Park Placer Co. near Gunnison the past season have had fifty-five men employed, and have built 1700 feet of bedrock flume. Next season the bedrock will be washed, from which values are expected. The company owns 3000 acres of patented ground.

HINSDALE COUNTY.

The Rob Roy property near Eagle was sold last week to the G. & S. Fleece M. Co. for \$2045. The property has been in litigation for years. Work will soon be resumed upon it.

LAKE COUNTY.

The Wolfstone owners at Leadville are receiving royalties on 4500 tons of ore a month.

PARK COUNTY.

At the Hook Hocking near Fair Play a large force are working, and a car of ore a day is being shipped.—From the Hill Top high grade ore is being taken out. About 400 tons was last month's shipment.—The Ruby, at Weston Pass, shipped over 500 tons of ore in November.

IDAHO.

The car of ore shipped by the Last Chance mine at Saltese recently netted about \$4,000 for the twenty-five tons.—Wemis Bros. shipped a carload of galena from the Empire State mine near Custer recently.—The Idaho Comstock mines at Dixie have nineteen claims in the group, all somewhat developed and with good showings on each, though development has been confined chiefly to the Comstock claim. On this is a double shaft 145 feet deep, with drifts and crosscuts aggregating over 500 feet. A steam hoist capable of sinking 300 feet is in operation. The ore is teamed to the mill, three-quarters of a mile, the location of the mill being determined the most convenient point for handling ore from the different claims with least haul. The mill is operated by water power, conveyed two miles in a box flume set deep enough underground to avoid freezing. The company contemplates to at once add more stamps and operate on a larger scale. W. T. Hiren is Gen. Man.—At Saltese the U. S. and Last Chance have made occasional shipments of ore for several years. They are both now being worked under lease. A new tunnel to cut 200 feet below the old works is being run. The Last Chance shipped one car a month for the last four months. The U. S. will make a shipment early in January. The ore from each of these claims yields about \$2000 a car above freight and smelter charges.—A strike has been made in the Checkmate mine at Willow Creek, opening a body of good ore. It shows an 8-inch streak that is said to run \$300 in gold.—F. R. Reed, who represents large mining interests in Elmore county, and is Mgr. of the Upper Boise Hydraulic M. Co. and the Josephine M. Co., says he will expend \$40,000 or \$50,000 next summer in developing various properties which his companies own in that county. He has lately organized a new company known as the Pennsylvania Placer Co. The properties of this new corporation are in Elmore county, near Mountain Home. A ditch will be constructed nine miles in length. He will put a large force to work as early as the season will permit. It is intended to operate six large giants. For the Pennsylvania Co. he has purchased and located 800 acres of placer ground. He will also build a sawmill on Fall creek to cut lumber flumes.

The Lucky Boy mine at Custer City the past summer saved 67 to 68 per cent of the assay values of its ore, and it is quite likely that the mill would have been kept in operation all winter were not the available space around the plant crowded with tailings. In spring, cyanide works will be added to the plant and operations resumed on a larger scale. Exhaustive tests have shown that the application of the cyanide process to the tailings, of which there is from 8000 to 10,000 tons at the mill, will effect a recovery of 85 per cent of the gold and from 60 to 70 per cent of their silver values. The company will keep thirty-five men all winter in development.

Boise Statesman: The Challenge mine near Boise has over 1300 feet of tunnels and shafts. Recently an ore chute was found in the lower tunnel 500 feet from the mouth. It has been opened up for 100 feet. The vein varies in width from 2 to 6 feet. The paystreak in the chute is 3 to 26 inches wide. The values run from \$50 to \$400 a ton, gold predominating. The owners have built a 2-stamp mill and concentrator to handle the lower grades of ore. A large quantity of ore is ready for shipment. Supt. Knight of the Challenge is working ten men.

MONTANA.

At Basin the shaft at the Hope mine is going down, between the 500 and 600-foot levels, with three 8-hour double shifts. H. L. Frank says that when the 600 is reached plans for a 500-ton concentrator will be asked for.—At the Eva May mine the shaft is being sunk to the 600-foot level. If they find on the 500 and 600 a continuation of the large ore body they have above, the Eva May will be a heavy producer.

The Speculator mine, near Butte, under operation by the Langley estate, is proving a good shipper. About 100 tons of ore per day are shipped to the smelter. One-third of this amount is high-grade copper, gold and silver, and the remainder is the usual average of con-

centrating ore of the Butte district. The shaft is developed to the 100-foot level, where the values rather increase than decline.

Libby News: The concentrator at the Snowshoe mine is unable to be operated on account of water shortage. The developments in the mine are being pushed. The tunnel is in about 1200 feet. A raise has been started at a depth of 1050 feet. There is an accumulation of concentrates at the mill and they are being shipped to Everett.—At the Rocky Fork coal mine of Red Lodge, the daily output is between 1300 and 1500 tons. One tunnel is in 10,000 feet and has not reached the limits of the property or the end of the seam. The main slope is 1275 feet down and another is down 1100 feet.—It is estimated that the output of gold from placers in Montana during 1898 will be about \$700,000, or a small increase over 1897. The increase is due in a great measure to the introduction of dredges at Bannack which inaugurated at new era in placer mining in Montana. With several new dredges in course of construction it is believed the output of placer gold in the State next year will be materially increased.

NEVADA.

The Horseshoe mine is in Eagle Valley mining district, Lincoln county. The ore on the 100-foot level now runs \$50.

F. C. Everett, accompanied by Fish & Jones of the Cuyahoga M. Co. owning mines in Smith Valley, have been inspecting their mines. They have had several tests of ore made at the Douglas laboratory at Dayton and are satisfied with the returns.—Near Como the Orpheus mine has been bought by the Cuyahoga Co. together with Merrimac and Feverish Hornet. The company will develop its property as soon as machinery can be put in. The Everett & Co. 5-stamp mill will be remodeled and concentrators put in to handle the pulp.

The company owning the Copper Canyon mines in Elko county will have a mill in operation next month.—J. F. Holland is reported getting copper ore out of his Mason Valley mine.

The Magnolia mine at De Lamar is working fifteen men; shipments are made the middle of each month of the high-grade ores, the low-grade being piled up for a mill which the company will build in the spring. The ore shipped more than pays prospecting expenses.

Winnemucca Silver State: The largest producing mine in White Pine county being worked is the Homestake. The ore body has been tapped by a shaft at 250 feet. The ore averages 68 per cent lead, 15 ounces silver and nets \$20 a ton after paying transportation to San Francisco and charges at the smelter. Over 1200 tons of ore were shipped between July 1st, '97 and July 1st, '98.—A new mining company known as the Tuscarora G. M. Co. has been incorporated at Salt Lake, and has bonded twelve claims in Elko county.

NEW MEXICO.

Santa Fe New Mexican: The Steeple Rock Development Co. of Grant county has disposed of its tailings to the Pacific Extraction Co. of San Francisco. The tailings will be worked by the cyanide process.—An ore body 30 feet wide, yielding \$12 in gold, has been uncovered in the Bull of the Woods mine, near Bland, by H. Lockhart.—The Crown Point M. Co. has made a strike on the Glencoe, near Bland, which is yielding fifteen ounces of gold.—The Edison M. Co., Red River district, has a force cleaning out the works, after which development on an extended scale will proceed.—Work has been resumed on the Stella property, Red River, and three shifts are being worked.—At Copper Hill in Taos county the Champion mine opened 8 feet of ore averaging \$40 to the ton, with some higher grade.—M. Ruthenburg will build a smelter at the Val Verde works at Paschal. There are several thousand tons of ore on the dump ready for smelting.—The Confidence mine in the Mogollons is producing eighty tons of ore daily.—The Othello and Desdemona mines in Cooks district are employing 125 men and putting out from 400 to 600 tons per month, which is sent to El Paso. The property belongs to the Kansas City Con. S. & R. Co.—The Iron mines near Silver City, operated by W. H. Newcomb, consist of twenty-seven claims. The development is mostly on the surface, the iron lying in shallow deposits, from 5 to 15 feet in depth. Twenty-five men are employed. The present production is seventy tons a day. A contract for shipments to El Paso has been secured for 1899, which will necessitate an increased output. The local smelter is using ten tons per day from these mines.

Santa Fe New Mexican: The Charter Oak mill, Hillsboro district, has been running for two weeks on ores from the Cincinnati and Prosper mines.—In the Cooney mine, in the Mogollons, the tunnel is to be extended to 900 feet.—At the Helen mine of the Confidence group the management is erecting a pipe line and water power to run the mill and light the mine with electricity and to furnish 500 H. P. for hoisting.—In the Cochiti district, the Black Girl property shows a 15-foot vein of good ore; the product will be treated at the Bland custom mill.—A strike has been made on the T. S. K. property in Colla canyon.—In the Red River district work has been resumed on the Stella mine. The property shows a 7-foot vein of \$30 ore.—A steam hoist and thirty men are operating in the Jumbo vein.—Denver investors have secured an option on the Edison mine and will erect a milling plant. The Edison ore averages \$20 per ton.

OREGON.

M. Alexander sold a half interest in his Navy Blue mine at Granite to J. W. Larkin for \$5000.

Ashtland Record: Supt. James has started a shaft at the Shorty and Hope claims from the 150-foot level, and has put three 8-hour shifts at work. They have found high grade ore, which will be sent to the smelter.—The

Shorty-Hope 10-stamp mill and residences are lighted with acetylene gas of twenty-four 25-candle power lights.—Supt. Crane of the Oro Fino mine is reducing five carloads of his ore at Ashtland.

Grants Pass Journal: Ferguson & Ferrier have sold their two-thirds interest in the Riverside group near Grants Pass to Cottage Grove and Portland people. The mine has 100 feet of tunnel on two ledges, showing in one place 4 feet of ore averaging \$40 to the ton, and the other ledge, 40 feet wide, shows an average of \$12 to the ton.—The Music mine in Lane county will make an early start in the spring. Hundreds of tons of high grade ore are on the dump. The 10-stamp mill has been completed.

Jacksonville Times: The ledge discovered by Hannum & Browning near Jacksonville is a foot wide and the ore assays \$90 a ton.—D. DeBar, who is developing a ledge near Jacksonville, had fifty tons of ore crushed with favorable results.—Hull & Beck, who are running a mill at their mine near Grants Pass, after a run of fourteen days cleaned up \$800.

Houck & Cox are developing a cinnabar mine near Gold Hill.—A quantity of ore from the mine prospected by F. G. McWilliams was lately crushed with good results.—Work will be resumed at Beekman & Huffer's mine Jan. 1. A long distance of tunnel has been run; a shaft will be sunk. Two tons of ore crushed last week yielded \$100.

SOUTH DAKOTA.

The number of tons milled by the 400 stamps dropped on Homestake ore at Deadwood for the past year was \$95,000.—The Highland, where 140 stamps are dropping, milled the past year 147,000 tons of ore, and the value of the output was about \$700,000.—The Kildonan at Pluma, where 47,000 tons of ore are treated yearly by the chlorination process, output this year \$845,000.

The chlorination plant at Rapid City has been started on ore from the Gilt Edge mine. Seventy-five tons are sent to Rapid daily. The plant is able to treat 100 tons a day.

UTAH.

At Bingham the Niagara Co. contemplates the treatment of its auriferous ores with the use of cyanide, and a plant will be erected during 1899. It has been shown here that ore of a gross value of less than \$5 in gold per ton could be made to yield a good margin.

The shipments out of Tintic last week were seventy-six cars of ore and thirteen of concentrates.—The McKinley Co., on Lion hill, uncovered 30 inches of ore, in which is a copper-stained streak from which three samples show 67.6 ounces silver, 201 ounces silver and 484 ounces silver per ton. In addition, the gold chute is showing good values.—The Highland Boy, at Bingham, has encountered ore in tunnel No. 7, at 500 feet, with copper predominating.—The old Jordan & Galena, which has been sending ores out of Bingham for more than a quarter of a century, has made a strike. In the meantime 3000 tons of gold ore are being leached monthly at the cyanide plant. These ores are averaging \$6 per ton in gold and six ounces silver, with a saving of 93 per cent of the former and 53 per cent of the latter in the product.

At the Old Jordan and Galena the new rolls have been started. The nine big tanks are now loaded.—The roasting of ores is progressing at the Cigale mill, West Dip. The bins are being loaded and the filling of the leaching tanks will soon begin.—On the Justice group of claims at Silver City the resumption of work has begun. The company expects to begin the extraction of ore within sixty days.—Work has resumed on the Song Birds at Mercur. The shaft has been put to a depth of 150 feet and has been productive of some values.—At the Showall placer, Bingham, machinery is being placed and sinking will shortly be resumed.—The Giant Chief mine has fifty tons of good ore on the dump and will soon make a shipment.—On the Midland at Bingham driving of the tunnel 5000 feet has begun.—The Jos Bowers made a second shipment of silver and lead ore. The first shipment yielded \$30 a ton. Assays of the second shipment of the week show 50 per cent lead and thirty-eight ounces silver, with a small amount of gold.

In the Centennial Eureka at Tintic ore has been exposed in different places containing silver and copper. The workings have attained a depth of 1500 feet. With the electric system of signals introduced, the miner in any part of the property is enabled to communicate with the surface. Electric lights will be placed underground.—At Diamond, the Midnight shaft is going down with three eight-hour shifts.—At the Alliance mine, Park City, the contact has been broken into, and the material is highly mineralized; manganese has also made its appearance. In this development over \$400,000 has been expended. Since the company began operations there have been assessments that in the aggregate reached \$310,000, while the investors paid \$1 a share for the stock. The tunnel has penetrated the zone for a mile, and at a depth of 1000 feet the contact has been reached.

Mercur Mercury: At the Daisy mine, recently, on the 200 and 300 levels, values are running \$25 per ton. A large body of this class of ore has been opened up.—The twelve new tanks at the Golden Gate mill are completed and will soon be operating. As soon as some difficulties with the electric power are surmounted, the mill will begin the treatment of 800 tons per day, and this will be increased soon to 1000 tons.—Another shipment of ore was made by the Northern Light last week, consisting of ore which assayed 126 ounces silver and \$4 gold per ton, and brought \$1500. Another shipment will be made soon of ore which yields 247 ounces silver.

Park Record: Shipments of ore from the Mackintosh sampler at Park City last week were: Silver King, first class, 945,840 pounds;

Ontario, 176,450 pounds; Anchor, concentrates, 375,690 pounds; total, 1,497,980 pounds.

WASHINGTON.

At Sheridan three shifts have been started on the Princess Maud tunnel. On the Nelson the ledge is about 8 feet wide. The Treasury tunnel is in ore, with values running from \$5 to \$8. The tunnel is in 360 feet. In the Victor the ledge is wide and the quartz averages \$6. In the Liberty the 2 feet of ore assays from \$5 to \$16. Considerable development work is being done on the Lucky Boy claim. The values run from \$33 upwards, and lie principally in silver.

Everett News: The Forty-Five mine, in the Silverton district in western Washington, will soon be able to haul in machinery and dispense with the costly pack train now used to haul ore out. Last month the Forty-Five averaged 102 men on their payroll. N. E. Downs of Seattle, a representative of New York capital in the Silver Creek district, has ten men working on the Merchant group. By Jan. 1 the compressor plant and power drill will be placed and work will be pushed on the lower tunnels, 500 feet below the upper workings. They are working in ore carrying gold, silver and copper in varying values. The Trident M. Co. is pushing development work. The Silver Creek G. M. Co. of Everett is developing a property near Galena. The Co-operative Co. is working a group of claims and has thirteen men employed. The Everett Hydraulic G. M. Co. has expended \$36,000 on its Ruby creek claims this season and will spend \$15,000 more next year in development of their mine.

FOREIGN.

BRITISH COLUMBIA.

Ymir has two shipping mines in the Porto Rico and Blackcock. The latter will ship from eight to ten tons of ore per day. The first cleanup of the Porto Rico mill last week was ninety-four ounces of gold in twenty hours run. This did not include the concentrates.

The Mollie Gibson M. Co. have made their final payment of \$40,000 on the Mollie Gibson group in the Slocan. The property was bonded for \$110,000.

Ore from the Wakefield is being hauled to Silverton for shipment. Over 2000 tons will be shipped this winter. The Comstock mines near Silverton recently shipped two carloads of galena to the smelter.

The B. A. C. last week in the Annie mine found two ledges which average \$50 in gold per ton. The ore shipments from Rossland last week show a decrease, due to the development in the Le Roi and to the inability to get cars at the War Eagle. The output was 1833 tons. At the Le Roi timbering is continuing all over the property. Old stopes that had been filled with broken ore have been cleaned out and stulls put in place wherever safety would require. Although shipments have been cut down to permit of this development work, the output of the mine last week amounted to 1050 tons.

At Grand Forks a Rossland company, represented by A. Dick, bought on a bond the Ruby claim for \$15,000, 5 per cent of which was paid in cash, the balance in payments extending over six months.

The Lexington property near Grand Forks was bonded to J. P. Graves of Spokane for \$40,000, of which a percentage was paid in cash. From Sandon the ore shipments for the week were 470 tons. The shipments from McQuigan for December to the 22d were 156 tons. From Three Forks last week the shipments were 250 tons.

LOWER CALIFORNIA.

The Ibarra G. M. Co. is said to have struck a rich body of ore in the Otilla at the 600 level, the deepest shaft in Lower California. The company was on the point of giving up the whole camp and dismantling its plant when this new body of ore, apparently leading to still larger finds, was uncovered.

MEXICO.

M. J. Cons is working eighty men in Las Catalanas mine, near Suqui Grande, Sonora. The ore is shipped. Near La Barranca he is developing another mine, in which he has cut a 10-foot vein of \$10 gold ore, which can be cheaply reduced by cyanide process.

Commercial Paragraphs.

The first of four duplex electric pumps being constructed at the Jeanesville Iron Works, Jeanesville, for the Colorado Fuel & Iron Co., Walsenburg, Colo., has been satisfactorily tested. The pump itself weighs 16,500 pounds and the electric motor 6300 pounds. It is 19½ feet long by 5½ feet wide and has a capacity of 390 gallons per minute against a head of 150 pounds. The motor is a 50 H. P. Pump and motor are connected by a double cut steel gear.

With the beginning of the year comes a change in the title of one of Denver's representative firms. The well-known establishment of Wm. Ainsworth, manufacturer of assay and analytical balances and sole manufacturer of Brunton's Patent Pocket Mine Transit, will, after to-morrow, be known as Wm. Ainsworth & Sons. Eighteen years of successful experience has given that firm enviable acquaintance, and assayers, engineers and miners have long learned to rely upon their representations and the quality of their supplies.

In the issue of the 10th inst. appeared an illustrated account of dry crushing at a South African gold mine, a specially written article, giving detailed description of the manner of crushing the ore dry. It is deemed of sufficient importance in supplying an omission in the article to state that the crushing machinery for the plant referred to was furnished by the Gates Iron Works of Chicago, being the first prominent installation in that

section of that grade of crushing rolls. The same firm has recently received an order from the Broken Hill Proprietary Co., N. S. W., for nine sets of their 36-inch high-grade rolls; in addition to that order the Gates people have furnished the same mining company five of their large breakers in the past six weeks.

Trade Publications.

"Sinaloa Illustrated" — "Sinaloa Illustrated," descriptive of the mines, agriculture, manufactures and commerce of the State of Sinaloa, Mexico, is the title and scope of an unusually fine folio just issued under the direction of the Government of Sinaloa by J. R. Southworth, 23 First St., San Francisco, being the second of a series setting forth the resources of the Mexican Republic. The work is finely printed, the reading articles appearing in parallel columns of Spanish and English and the illustrations receiving appropriate attention. Many of the views and much of the material are the result of arduous personal effort on the part of the editor. Mr. Southworth preferred getting his facts and photos at first hand, and visited several parts of the State of Sinaloa for fresh and authentic material for his book—a work that should aid in creating and maintaining cordial trade relations with our sister republic.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade

mark. Our German drawing instruments bear only the trade marks  or . We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for

in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & Co., PATENT SOLICITORS,

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced
first-class agency. We have able and trustworthy associates and agents in Washington and the capi-
tal cities of the principal nations of the world. In connection with our scientific and Patent Law Li-
brary, and record of original cases in our office, we have other advantages far beyond those which can
be offered home inventors by other agencies. The information accumulated through long and careful
practice before the Office, and the frequent examination of patents already granted, for the purpose of
determining the patentability of inventions brought before us, enables us to give advice which will
save inventors the expense of applying for patents upon inventions which are not new. Circulars and
advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market
St., San Francisco, Cal.

GOLD IN COLORADO!

Colorado has within its limits some of the great-
est gold mines that has ever been discovered. In
Cripple Creek in 1892 there were a few prospectors
looking over the hills; in 1895 the camp turned out
over \$5,000,000 in gold. Leadville, the old bonanza
camp and the mineral product of which made Den-
ver what it is to-day, is becoming a big producer of
gold. New inventions for working low-grade gold
ores, together with the discoveries made to work
rebellious ores, have opened up a field for the min-
ers such as they have never enjoyed before, and
Colorado has inducements to offer such as no other
district in the world possesses; the record of the
State in gold production for the last three years
speaks for itself. Among the other prominent
camps in the State are Telluride, Ophir, Rico,
Silverton, Mineral Point, Durango, La Plata,
Ouray, Saw Pit, Ironton, the Gunnison district and
many others. New finds are being made and new
camps are springing into existence every day.
The Denver & Rio Grande Railroad, which is the
pioneer road of Colorado and which has always
been the mine's friend, reaches all the mining
camps in Colorado. For elegantly illustrated
descriptive books, free, of mines in Colorado

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

WHITE, ROGERS & CO.,

Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

— SEND FOR CIRCULARS. —

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 29, 1898.

SILVER.—London, 27 3/16d; New York, 59; San Francisco, 59; Mexican Dollars, 47 1/2 @ 48. New York exchange, sight, 15; telegraphic, 17 1/2 cents premium.

The imports of treasure at San Francisco for the first eleven months of 1898 amounted to \$32,339,719 against \$12,320,849 for the same period in 1897. Included in the imports this year was \$24,337,278 in gold coin from Australia. The mail steamer next due brings \$2,500,000 more. Such large shipments of gold from Australia to San Francisco suggests to Bradstreet that the movement in question is taking the place of direct transfers of specie from the European financial centers to New York. Under existing circumstances, in connection with our foreign-trade balances and the action of the exchange market, it is fair to presume that operations of the same character, possibly on even a larger scale, are likely to mark the coming season. While the gold imports from Australia are an indirect way of settling part of the balances which Europe owes the United States, they have the advantage of avoiding any disturbance of the London or continental money markets which might readily follow gold withdrawals from the Bank of England, an effect which is decidedly undesirable when Europe and London in particular are evincing such a renewed disposition to purchase American securities.

LEAD.—New York reports, "firm," \$3.85 bid, \$3.90 asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead \$3.67 1/2.

Local, pipe, 6 @ 6 1/4 c; sheet, 6 1/2 @ 7 c; pig, 5 1/2 c; bar, 6 c.

COPPER.—New York reports Lake "firmer," \$12.90 bid, \$13 asked. Local, bar 20 c per lb.

IRON.—American, soft, \$21.75 and \$23.75 per ton; Scotch, \$24.25. Local bar, 2 1/4 c per lb.

SPELTER.—8 1/2 @ 9.

TIN.—Pig, 22 c per lb.; Bar, 25 c.

ANTIMONY.—14.

BABBITT METAL.—No. 3, 7 c.

QUICKSILVER.—Steady. Local, \$41.00; export, \$37.50 @ \$38.00; carload lots, special rates.

Assessment Notices.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of December, 1898, an assessment (No. 32) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of January, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on THURSDAY, the 28th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors, CHARLES E. ANDERSON, Secretary.

Office—Mills building, room 31, 16th floor, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of December, 1898, an assessment (No. 22) of three (3c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors, CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 5) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors, GEO. W. FLISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

REPUBLIC and ROSSLAND Mining Stocks

Bought and sold for non-residents. SOLID DIVIDEND PAYERS as an investment. Prospective producers as a speculation. Write for information.

H. P. PALMER & CO.,

Exchange Nat. Bank Bldg., SPOKANE, WASH.

HERRIN & REINER, Mine and Stock Brokers.

Reliable Quotations given on all the Standard British Columbia, Washington and Idaho Mining Stocks.

Rooms 9 and 10, Zeigler Block, Spokane, Wash.

DELINQUENT SALE NOTICE.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 15th day of November, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|--------------------|-----------|-------------|---------|
| William Day..... | 602 | 100 | \$10 00 |
| George Straut..... | 625 | 1,000 | 100 00 |
| George Straut..... | 648 | 500 | 50 00 |
| E. P. Hill..... | 637 | 150 | 15 00 |

And in accordance with law, and an order from the Board of Directors, made on the 15th day of November, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 213 Jackson street, San Francisco, California, on TUESDAY, the 17th day of January, 1899, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. J. MIDDLETON, Secretary. Office—213 Jackson St., San Francisco, California.
